MARSHMAN, Joshua, colleague of Car-
ley and Waid, born in 1768, at Westbury
Leigh, the son of a weaver and Baptist mi-
nister He arrived in India in 1799 He
had many bitter personal enemies, possibly
caused by something in his manner, and
from his entertaining the mistaken theory
that men are most easily controlled by ma-
nagement and conciliation, from acting on
which many supposed him to be a schemer
and insincere But though he stated his
views with moderation, he was unbending
on matters involving a principle

MARWAR, HIND *Bauhinia racemosa*

MARWAR is a corruption of Maroo-wai, classically Muost'hai or Moorost'han, the region of death. It is also called Maroo-desa, whence the Maides of the early mahomedan writers. The bards frequently style it Moid'hun, which is synonymous with Maroo-desa, or, when it suits their rhyme, simply Maroo. Though now restricted to the country subject to the Rihator race, its ancient and appropriate application comprehended the entire 'desert,' from the Sutlej to the ocean. The sac'-hwe or branches of the Rhatot, early spread over the desert. The fabulous genealogy of the Rhatot deduces their origin from the raht or spine of India, then nominal father being Yavan-aswa, prince of Palipur, which they say was somewhere in the north. This indicates their Scythic origin, the Asi or Aswa being one of the four Scythic peoples who overturned the Greek kingdom of Bactria. Doubtless the Indo-Scythic people from the Oxus to the Ganges were one race and ancient hindu cosmographers claim the Aswa as a grand branch of their early family. But there are no available data for any of the great Rajput families beyond the fourth century of this era. This was the period of one of the grand irruptions of the Getic races, from Central Asia, who established kingdoms in the Punjab and on

the Indus, and that they were a pastoral race is evidenced by the term Pal or Pahi, which is an adjunct to every proper name. In the scant records of Alexander's invasion, mention is made of the Asarena and Asacant as still dwelling in the countries on and beyond the Indus, but the period of the fourth century, at which time the Hun, the Parthian and the Gete had founded colonies on the western and northern frontier of India, was fruitful in change to the old established dynasties of the Indian continent. Marwar, in 1805, continued to be greatly invaded. At the commencement of 1869 the Political Superintendent of Sirohi discovered that, both in that state and in Marwar, the practice of Samadh, or burying alive, prevailed to a considerable extent, though confined almost entirely to persons in the last stage of leprosy, by whom it was practised to put an end to their sufferings. As it was thought probable that in some cases priestly influence, and in others the desire of the other members of the family to rid themselves of the presence of a nuisance, might have induced the self-sacrifice, the Political Agent considered it advisable to bring to the notice of the Durbar of His Highness the Rao of Sirohi, that Government regarded the commission of a Samadh in the same light as a suicide, and that they would expect His Highness to use his best endeavours to put a stop to it. It was also noticed that in case of his not doing so, he would incur the displeasure of Government, and the number of guns with which he was saluted would be reduced. His Highness at once issued a proclamation declaring that Samadh was forbidden, and that any one assisting at any case in future would be liable to imprisonment extending to ten years, that the jighindri on whose estate it took place would be liable to the same punishment, and the forfeiture of his estate, and any ivy official, through whose culpable neglect a case might occur, would also incur the same liability. The maharajah of Mewar was also addressed on the same subject, although the Political Agent of that province could not hear of any cases having occurred—*Tod's Rajasthan*, Vol II, p 9. *Englishman*, April 25. See India

MARWARI, from Marwar, a country in Rajputanah, but in India generally applied to a native of Rajputanah, engaged in banking or trade. There are, however, in India, various tribes who are known as bankers, soukar, and suriaff or shroff, viz the Marwari, the Bhatya, the Vesya Komati, the Modi gram seller and the Bania. The Marwari of Marwar in Rajputanah

arrange themselves into twelve tribes, amongst whom are the Mestri, Agiwala, Uirai, Oswal, Sarogi, Kandelwal, Bijabangi, Poiwal, some of these are hindus, and some are of the Jain sect. The Mestri, the Uirai, Bijabangi, Kandelwal and Poiwal are of the vaishnava sect of hindus, the Agiwala are partly vaishnava and partly jain, but the Sarogi and the Oswal are wholly jain and it is from amongst the Ossi tribes of Oswal that the jain priests of Abu are chosen. They never use animal food, their offerings are fruits and sugar, and the Oswal and Sarogi never eat the prasadh or meat offered to the idols. Those races are less frequently of the saiva sect. The Marwari, the Ve-ya Komati, the Modi grain-seller and the Banya, are distinct races, altogether dissimilar in personal appearance, the Marwari from the desert being tall, bulky, yellow men, while the Wani or Banya of the peninsula are, a smaller and dark colored race. The Marwari mercantile men and bankers hold almost exclusively the entire banking business of India. The Marwari of Jeypur regulate the exchange operations of almost all the nations of India. Colonel Tod tells us that they are of Rajpoot origin, and that the Oswal is the richest and most numerous of the eighty-four mercantile tribes of India, and is said to amount to one hundred thousand families. They are called Oswal from their first settlement, the town of Ossi. They are all of pure Rajpoot birth, of no single tribe, but chiefly Pura, Solanki, and Bhatti. Many profess the jain tenets, and it is a curious though little known fact that the pontiff of that faith must be selected from the youth of Ossi. The wealthy bankers and merchants of these regions, scattered throughout India, are all known under the denomination of Marwari, which is erroneously supposed to apply to the Malwah and the Jodpore territory, whereas, in fact, it means belonging to Mann, or Maust'han, the desert. It is singular, he adds (*Rajasthan*, Vol II, p 234) that the wealth of India should centre in this region of comparative sterility. The Marwari is essentially following similar mercantile pursuits to the Vaisya Komati of peninsular India, and those of the Wani or Bani or Banya, viz, banker and merchant, to which however the Komati add that of retail shop-keeping. If a Marwari engaged in business in the peninsula, be asked as to his caste, he replies that he is a Mahajan, a Bania, a Bais, or Vais, meaning that his profession is that of the commercial people. But on further questioning, he explains that originally the Marwari was a Rajpoot, that there are

twelve great tribes, of whom are the Oswal, Messai, Agawala, Bejabangi, Saragi, Nedatwai, Parwai, and five others. These all subdivide into innumerable kap or clans, in the Messar tribe alone are 72, amongst whom are the Rathi and Dhaga. All the Marwari of Rajputanah adhere to the gotra principle, reckoning their descent from a founder, and in their marriage ceremonies they abstain from blood relationship, never marrying into their own gotra, they seem to be of Aryan origin. Their widows never remarry. It is a curious and little known fact, that almost all the mercantile tribes of Western India are of Rajpoot origin, and sank the name and profession of arms when they became proselytes to Jainism, in the reign of raja Bheem Pramad. The Chetore inscription (see Vol I, p 799, and note 7, p 800), records the name of this prince. He was ancestor of raja Mann, whose date S, 770 (A D 714), allows us to place this grand conversion prior to A D 650. The Banya or Komati are generally of the vaisya sect of hindus, though some of them worship Siva. They are most numerous in Telingana and in Madras. In the north and east of Dekkan proper there is not one of them in twenty villages, their places then being taken by the Marwari race. There are however many in Panderpur, and Sholapoor. Those of the Komati who die unmarried, are buried, all others are buried whether belonging to the saiva or vaishnava sects. Their language in their families is Telugu, and it is spoken by them as far as Bombay. But as the west is approached, Maharati becomes mixed with it. The Banya are essentially shopkeepers, sellers of dry grains, doing a little in mercantile business and cultivate, but do not hold the plough. They are mostly dark men, of short stature. In their marriages the bridegroom may or not be before or after puberty but girls are under age and the ceremonial is performed at the house, by a brahman. The death shrad are conducted by brahmins. Their janawi or zonnai is put on and the mantra taught when married. The Wani of the Western Coast will only marry with the Komati Banya. They are in considerable numbers in the northern part of Hyderabad, adjoining Berar — *Tod's Rajasthan*, Vol II p 134, 234.

MARWARID AR PERS a pearl

MARWAT and Bannu are on the same plain. The people of Marwat are larger in stature than those of Bannu and are usually clad in coarse white linen like the Afghan on the banks of the river Indus.

core wood, of a yellow colour, used for packing cases — *Col Frith*

MARYUL or Lowland, from mai, Tib low, and yul, land, the non-Chinese portions of the Bhot territories. These are arranged by Col Strachey as that of Bulti, which is the mahomedan name, and includes Hasoria, Rongdo or Rongyul, Shigai, Skado or Bulti Proper, Parkuta, Tolti, Khartaksho, Khis, Khaypalu and Chorbati and the buddhist Ladak in which we have Spiti, Zangskar, Purik, Sura, Hembaks (Dias,) Ladak proper or Le, Nubia, Jankstee, Roug, Rupshu and Hanle. In this list of Strachey, Lahul, Hunglung and Kunawar are omitted as Indian, whilst Hasoria is treated as Bhot — *Latham, Ethnology*

MARZANJOSH — ? *Oiganum vulgare*
MAS, MALAY Gold

MASAH, AR. HEB. Anointing, a form of installation, which is practised in Europe but seems to have been of Eastern origin, derived perhaps from the Assyrians. The "masah" of the Arabs, forms the Hebrew messiah, meaning the anointed one. In Rajputana "anointing" appears to have been, in all ages the mode of installation. The unguent on this occasion is of sandalwood and oil of roses made into a paste, or very thick ointment, of which a little is placed upon the forehead with the middle finger of the right hand, and then the jewels, the aigrette and necklace, are tied on. Amongst the earliest notices of this ceremonial is that in Genesis xxviii, when Jacob rose up early in the morning, and took the stone that he had put for his pillow, and set it up for a pillar and poured oil upon the top of it. The brahmans anoint their stone images with oil before bathing, and some anoint them with sweet-scented oil. This practice probably arises out of the customs of the hindoos, and is not necessarily to be referred to their idolatry. Anointing persons, as an act of homage, has been transferred to their idols. There are resemblances betwixt the Jewish and hindu methods of, and times for, anointing. Oil is applied to the crown of the head till it reaches all the limbs it is called abhyanga which is noticed in Psalm cxxxiii 2 "It is like the precious ointment upon the head, that went down to the skirts of his garment." Again we are told in Mark xiv 3 that there came a woman, having an alabaster box of ointment of spikenard, very precious, and she brake the box, and poured it on his head, — and, pouring sweet-scented oil on the head is common amongst the hindu. At the close of the festival in honour of Durga, the hindu races worship the unmarried daughters of

brahmans, and amongst other ceremonies pour sweet-scented oil on their heads. Amongst the hindu, the ceremonial is attended to after sickness, which in Psalm xiv 7 is mentioned thus 'thy God hath anointed thee with the oil of gladness.' And hindus, when fasting, or in sickness, or sorrow, abstain from the daily anointing of the body with oil, and again anoint on recovery as in 2 Samuel 20, where 'David arose from the earth, and washed, and anointed himself, and changed his apparel, and came into the house of the Lord, and worshipped.' Bathing, anointing the body with oil, and changing the apparel, are, among the hindus, the first outward signs of coming out of a state of mourning, or sickness — *Ward Hindoos, Tod's Rajasthan, Vol II p 568*

MASALA, properly spices or compounds of spices, also used to mean any compound or substance used in any manufacture or operation. See Massala.

MASAILMA and El Aswad, in mahomedan history called the hairs, lived in A.D. 632, in the time of Mahomed. The first was of the tribe of Hanela, of the Yemama province and a man of consideration. He at first embraced mahomedanism and then for a time set up as a prophet on his own account, as a rival to Mahomed, and near the close of the latter's career. He afterwards was slain at Akriaba in a battle near Yemama with Khalid ibn Walid, whom Abu Bakr, Mahomed's successor sent against him. He fell by the hands of a Negro slave, named Walisha, with the same weapon that had despatched Hamza the uncle of Mahomed.

MASIBATAT AR in Arabic medicine Hypnotica

MASJID with mahomedans, is any place

MASKAT

of prayer, private or public. From "masjid" is derived the word "mosque" changed by the Egyptian Arabs who pronounce the letter j as a hard g, so that jab'l a mountain, jam'l a camel and masjid a mosque, become gab'l, gam'l, masgid — *Pilgrimage to Meccah*, Vol I p 141.

MASJID-I-SULEIMANI BUZURG, See Lunistan.

MASKAT is built on a slope, rising with a gradual ascent from the sea, where the water nearly washes the bases of the houses. The greater portion of the inhabitants are of a mixed race, the descendants of Arabs, Persians, Indians, Syrians, by the way of Baghdad and Basrah, Kurds, Afghans, Beluches, &c. The Persians at Maskat are mostly merchants, who deal in India piece-goods, coffee, hookahs or kaleans, and rose-water. Others, from Bunder-Abbas, Lar, and Menon, manufacture swords and matchlocks, for which there is a great demand in the interior. Banians constitute a body of the principal merchants, there are a few Jews, who mostly arrived there in 1828, being driven from Baghdad, by the cruelties and extortions of the Pacha Daud, when nearly the whole of this race were compelled to fly. Some took refuge in Persia, while others, in their passage towards India, remained here. The same toleration exercised towards all other persuasions is extended to the Ben Israel, no badge or mark, as in Egypt or Syria, being insisted on. The Jewish population of Maskat and Muttrah were estimated by Wellsted at sixty thousand souls. During the first quarter of the 19th century, about four thousand slaves, of both sexes and all ages, were disposed of annually. The Towah, from the Zanzibar coast, formed one class. They are known by having their teeth filed, sometimes to a point, and sometimes in notches like those of a saw, also with some perpendicular incisions on either cheek, made with a pen-knife when the children are five or six years of age and the scars which remain denote the tribe to which they belong. The price of a Towah was from 40 and 60 dollars. The Nabis, another race who come from the interior of Africa, are said to be vindictive and treacherous. The Bedow here as in the Hejaz, are the only purchasers. The Galla brought from Abyssinia, were highly valued, they fetch from one hundred to one hundred and fifty dollars, the price of the women being about the same as that of the males, and strength, health, and good temper in the latter, are considered as a set-off against the comeliness of the former. They bring eunuchs occasionally from Daful, which fetch from two to

three hundred dollars, and are mostly purchased by the Persians. Maskat is often visited by a large gampus, which sailors call the Maskat Tom, and the Arabs Ovey. It sometimes capsize their boats, and plays, according to the report, other mischievous pranks — *Wellsted's Travels*, Vol 1 pp 13 to 388

MASON WASP, of Ceylon, is the *Pelopæus spinola*, St Figeau, one of the *Sphegidae*. The *Ampulex compressa* which drags about the larvæ of cockroaches into which it has implanted its eggs, belongs to the same family

The male of the mason wasp of India, is about $1\frac{1}{2}$ inch long, of a bright brown yellow. The female is about $\frac{1}{4}$ of an inch long, of a bright bottle green. The male makes a round house of mud, in compartments, into each of which the female drops a few eggs and the male thrusts in large green caterpillars for the subsistence of the young — *Tennant's History of Ceylon*

MASR The old citadel of Masr, in Nicubul's time, was inhabited by none but christians. In it are to be seen several churches of the Greeks and Copts, with a convent of monks, of the latter nation. A grotto under one of the Coptic churches, is regarded with high veneration, because it is supposed to have been the retreat of the Holy Family, when they fled into Egypt. The Greeks have a church famous for a reputed miracle of a singular nature. Fools recover their wits, upon being bound to a certain pillar of it — *Niebuhr's Travels*, Vol I p 64

MASSAGA See *Kaffir*

MASSAGETÆ According to Strabo (lib xi), all the tribes east of the Caspian were called Seythæ. The Dahæ were next the sea, the Massa-getæ and Sacæ more

eastward, but every tribe had a particular name. All were nomadic, but, of these nomads, the best known are the Asi, the Pisani, Tachari, Sacamani, who took Bactria from the Greeks. The Sacæ made incursions into Asia, similar to those of the Cimmerians, and possessed themselves of Bactria and the best district of Armenia called after them Sacæ-senæ. Of the first migrations into India of the Indo-Seythæ Getae, Takshak, and Asi, that of Sehesnag from Sehesnagdes (Takshak from Technis-t'han) six centuries before Christ, is the first noticed by the Persians. About the same period a grand incursion of the same races conquered Asia Minor, and eventually Scandinavia, and not long after the Asi and Tachari overthrew the Greek kingdom of Bactria. The Romans felt the power of the Asi, the Gatti and Cimbari from the Baltic shore, Colonel Tod (Vol I, p 19,) supposes the Asi and Tachari to be the Aswa and Takshak or Tooishka races of the Poorans of Sacadwipa. The Dahæ to be the Dahya, now extinct, one of the 36 Royal Rajput tribes, and he supposes them to be the descendants of Baldeva and Yudishtira, returned under different appellations. The country on the east is still occupied by the Turkoman race. Herodotus (*Her. Cho* I, c 216) mentions that they were said to eat their aged relatives, when any one was far advanced in years they killed together their immediate friends and neighbours, and having sacrificed him, made a common feast upon his dead body — *Chapfield Hindoostan*, p 181 *Herod lib* I, sect cxxvi. Indus—Bom Geo Trans 1836-1838, Bombay reprint vol 1 2—*D. Bruist*

MASSOWAH A harbour on the west coast of the Red Sea Eight or ten of the largest ships with double the number of smaller ones could be securely moored in the harbour There is also a good harbour called Daba-leah, larger than Massowah, about a mile to the north In both of these the water is quite smooth The fresh water supply is from tanks in the island of Massowah There is fresh water also at Daba-leah Fresh water is not abundant either here or in any other part of the Red Sea, but the supply at Massowah could probably be increased by digging wells on the mainland There is a pier with facilities for landing on Massowah island which is connected with the main land by low wet ground about a mile in length The rainy season is from November to March It is 380 miles from Aden and 290 from Perim The navigation for the greater part of the way is clear and safe, and for the whole way in the day time for carefully navigated ships There is no other spot but Massowah and its immediate neighbourhood where ships could lie safely for any time, and where troops and munitions of war could be disembarked with celerity and safety—*Lieut Col H James, R E, in Par Paper*

warm weather equally grateful and salubrious—*Ouseley's Travels*, Vol I p 268

MASTAKA, also Chinna Mastaka, in hindu idolatry, is a form of Parvati as Kali, and, possibly, is the sakti of Siva, in the form of Kapali She is described as a naked woman with a necklace of skulls, Her head is almost severed from her body, and her blood is spouting into her mouth In two of her hands she holds a sword and a skull In a note in Mr Ward's work on the Hindoos, it is stated that this goddess was so insatiate of blood, that not being able at one time to obtain enough of that of giants, she cut her own throat to supply herself therewith Ward derives the name from Chinna, cut off, and mastaka a head—*Cole Myth Hind*, p 94 *Ward's Hindoos* See KALI

Mastic resin is produced in Scio, from the Pistacia lentiscus, the mastic or lentish tree The process of collecting is in most respects similar to that employed in obtaining the other resins That which collects on the branches of the trees is called mastic in the tear, and fetches the highest price, while that which falls to the ground constitutes the common mastic Mastic varnish is well known from its transparency, and other valuable properties, one of which is its peculiar toughness and tenacity even when spread in the thinnest coat, on wood or on canvas This is due to the presence of a peculiar resin, which does not possess any acid properties, and which has a composition C 40 H 31 O 2,—the acid resin of mastic containing four equivalents of oxygen It is imported into India from the Persian Gulf also from Kabul, and is used by the natives as an astringent in diarrhea, which property it owes to the volatile oil contained in it, 'also in all diseases depending on an undue accumulation of phlegm' Price 1 sh per lb—*McJulloch's Commercial Dictionary*, p 796 See Mastic

MASUFIR — *Carthamus tinctoria*

MASULA BOAT, a boat used on the Madras coast, for crossing the surf The planks are sewed together and the boat has no thwarts They are used in landing and discharging cargoes, and carrying passengers to and from ships in the roads They are sometimes broken to pieces from the heavy surf, which, at times, runs as high as from six to ten feet A catamaran can be kept in attendance, as a life preserver, in the event of any accident to the masula-boat, by upsetting or in case of any of the Europeans being washed out by the surf The masula-boats receive their cargoes and passengers from the ships outside the surf They are rowed by twelve men, with bamboo or casuarina paddles, that is, a board about ten inches broad and fourteen inches long, fixed at the end of a bamboo or young casuarina tree They are steered by one or two tindals (coxwains) and two men are constantly kept to bale out the water, from which employment they are promoted to the paddle, or bow-oar, after which they fall aft,

MATA-GLAP

in rotation, to be a tual or steersman The steersman gives time by a song, which is sung by all the boatmen, and according as its modulations are slow or quick, the oars are applied These modulations are regulated by the waves, as they may be slow or rapid, in succession, on one occasion, when a passenger of rank showed impatience at this noisy song, the boatmen were desired to cease, but the steersman refused compliance with the order, saying, that without his song he would not be answerable for the safety of the passenger The dimensions of the masula-boat are from thirty to thirty-five feet in length, ten to eleven feet in breadth, and seven to eight feet in depth — *Note by Sir J Malcolm Edye Orme*

MASULIPATAM, in lat 60° 9' N long 81° 10' E a large town on the Coromandel Coast The Masulipatam tract of country lying between the Hyderabad country and the sea, has a population of 520,866 and the collectorate formerly took its name from the chief town in the district which is now designated the Kistnah district Ellore is another large town Masulipatam is supposed to be the ancient Mesolia It was first taken by the British on the 6th April 1759

MATCHE COTTE TAM See Bullar

MATCH'HI, also Match'hi HIND Fish

MATCHLOCKS of a peculiar make are manufactured in the Shorapore district, as also jumbea, knives, daggers, &c, &c. The prices of these would be according to commission, and the amount of inlaid work, silver or gold, which, if employed at all, might be required the price of a good matchlock without ornament is from 10 to 12 Rupees. A superior matchlock is made at Koteli, the barrel is filed smooth on the outer surface and being carefully cleansed from grease by scouring with wood ashes, is set upright in a hollow cylinder of brass, which is filled with a solution of white vitriol in water. The cylinder is placed upon a slow fire, and in two days, the veins of the damask are developed in high relief. Nothing can be imagined more elegant than the twisted damask of Koteli. It surpasses that of Herat. The straight damask being less tenacious than the twisted variety, should be made of greater solidity. Neither can be compared for effective strength with the gun barrels forged according to the English process, in which the barrel being formed, is twisted at welding heat upon the mandril. But, there is no doubt that the Koteli barrels are superior in strength as well as in beauty to ordinary matchlock barrels, for the whole of the metal becomes consolidated, and rendered fibrous by the intimate twisting of its several parts. The worst feature in the process is the want of care in the construction and finish of the inner surface. The rude measures employed are quite insufficient to assure us that the lips of the rib-

MATCHLOCKS

band have met in every part, or that the square bits turned with no velocity by the hand have effaced those irregularities of surface which endanger the life in loading. The bore, not being a true cylinder, and the ball being seldom wrapped in cloth or leather, it is impossible that the piece should carry with precision, or that with any given charge, it should range so far as a fuzil of the same calibre. Matchlocks are almost universally constructed with an oviform chamber, which is harmless enough with the weak gunpowder of the bazaars, but dangerous when English gunpowder is employed. It no doubt economises the charge. The barrel is made to swell abruptly at the breach to accord with the shape of the chamber. The matchlock of Herat is generally rifled, a process unknown at Koteli, where, however, flint and detonator locks are made superior to those of most Indian fabrics. The rifling process is very rudely contrived at Herat. In a cylinder of hard wood corresponding in length with a gun barrel, two parallel and spiral grooves are rudely chiselled, a collar of wood is formed in an upright post, opposite to another post, into which the barrel is to be jammed, and within this collar are two short iron pegs, fitting into the grooves of the cylinder. A boring rod is then firmly attached to the cylinder, the cylinder, forming both handle and guide. The boring bit is a cylindrical rod rather thicker toward the extremity than elsewhere. Its thickest portion exactly fits the muzzle of the piece. It has a groove at the extremity, into which fits a small sharp wedge of hardened steel. When first inserted into the barrel, this wedge scarcely projects above the surface of the boring rod. It is now introduced into the muzzle, and the wooden cylinder is pushed forward by the workman who leans his weight against it. Of course as it enters the barrel, the spiral grooves of the wooden cylinder being guided by the fixed pegs in the collar give the rod and bit a corresponding spiral motion by which a spiral scratch is made in the interior of the barrel. The wedge is then slightly heightened and the scratch is thus deepened, until the workman considers it sufficient. This process is repeated until six or seven grooves have been formed. The Herat rifle being carefully loaded with balls wrapped in leather or cloth is tolerably true. All the beauty and advantage of the Koteli manufacture are attainable without any of the defects attending the rude treatment of the material in an Indian smithy. That is to say, the solidity and the fibrous consistency given to the iron, and the elegant damascene upon the barrels

may consist with a perfect inner surface of the cylinder. But such barrels could not, safely, be made so light as the British twisted barrel, a consideration of little moment as regards rifles in which weight is essential to steadiness. The price of the best Koteh barrel without ornament, is about 15 rupees, or 30 shillings. The fabric is generally considered the best in India.

MATELOFA ISLANDS are the most western of the extensive chain of islands called Carolinas, which stretch nearly east through the middle of the Pacific Ocean chiefly between the parallels of lat 7° to 10° North — *Holsburgh*. See Yap or Uruwb.

MATE-YERBA, Paraguay Tea. The leaves of an evergreen shrubby plant (*Ilex Paraguayensis*), largely consumed, in the manner of tea, in many parts of South America, where they are the subject of extensive commerce. The manner of using it is as follows: a pinch of the leaves is put into a small cup of warm water, and the infusion is imbibed through a little tube pierced with small holes, in the lower part, which only allows the passage of the water, and keeps back the leaves. The same leaves serve for three infusions. It is drunk by some with sugar or lemon-juice, and is used at all times. The plant might be introduced into India.

MATH HIND of Kuhat a quality of a marsh land.

MAT'H, Ast'hol or Akora, are the residences of the monastic communities of the hindus, and are scattered over the whole of India. They generally comprehend a set of huts or chambers for the mahant or superior, and his permanent pupils, a temple sacred to the deity whom they worship, or the samadh or shrine of the founder of the sect, or some eminent teacher, and a Dharmasala, one or more sheds or buildings for the accommodation of the mendicants or travellers, who are constantly visiting the Mat'h. Most Mat'h have endowments of land, generally of small extent, but as the Mat'h are numerous, the quantity of land in a district pertaining to a Mat'h, is extensive. But, besides lands, they receive presents from lay votaries, ask alms daily in their neighbourhoods, and sometimes traffic. The Mat'hs of various districts look up to some of their own order as chief, and under the presence of this chief mahant, on the demise of any of their brethren, they elect a successor from amongst the chela or disciples, the new mahant being regularly installed at the hands of the president of the assembly, by investment with the cap, the rosary, the

frontal mark or tika or other monastic insignia. In these matters, the British Government never interfere. Amongst the hindus, there is a lay and a priesthood class, the latter being sometimes monastic, and sometimes secular, and the vaishnava sect leave this a matter of choice. The Vallabha Chaitany sect, indeed give the preference to married teachers and all their Gosam are men of business and family, the preference, however, is usually assigned to teachers of an ascetic or cenobitic life. The cenobitic members of the different communities, at one period or other of their lives, have pursued an eremitic mendicant life, travelling over India singly or in bodies, subsisting by alms, or merchandise, or some of them, as must be the case amongst such large bodies of men, by less unexceptionable means, like the Sarabaites of the East, or the mendicant friars of the Latin Church. The preference, indeed, is usually assigned to teachers leading an ascetic life. The doctrine that introduced similar unsocial institutions into the Christian church, in the fourth century, is still most triumphantly prevalent in the east, the land of its nativity. Monastic establishments and solitary mortification originated in the specious appearance and pompous sound of that maxim of the ancient philosophy that in order to the attainment of true felicity and communion with God, it was necessary that the soul should be separated from the body here below, and that the body was to be macerated and mortified for that purpose. The Math is under the entire control of a mahant or superior, with a certain number of resident chela or disciples, with a large number of vagrant or out-members — *Professor Wilson in As Soc Proceedings*. See Jain, Jogi or Yogi, Brahma or Madhavaehari.

MAT'HA, HIND ? A tree of Chota Nagpore, with a hard, white timber — *Cal Cat Ex* 1862.

MAT'HA, or mother, is a term applied only to the sakti of the god Siva. It is said that Mylitta of the Babylonians, a name of Suenoth-Benoth, also means, mother. The wife of Siva is also called Vali or Bahi, under which appellation she assumed the form of a girl twelve years of age. In Madura, at Balano and other places, virgins used to go to the temple once in their lives to offer themselves in honour of the goddess. The story was that a god had intercourse with them. In all the temples of Siva and his consort, women are kept to dance and sing before the idols — *Roberts, Or Ill* p 11. See Mata.

MATS

Matten,	DUT	GERM	Tikal, Bogor, Kalasa,
Nattes,		FR	klasa, galeran, MAJAY
Chattai,	Guz	HIND	Burya, PER
Stuoje, Stoje,		IR	Estenas, PORT SP
			Progoshki, RUS

Mats are formed of rushes, of the bark of trees, and of the leaves of different species of palm trees, interwoven Mats are made in all countries In Russia, a kind termed bast mats are largely manufactured from the inner bark of the lime tree China mats are in general use in India for covering floors and lining stair-cases, and in India, in places where the bamboo or cane grows readily, mats are made of these materials, as also of

<i>Andropogon muricatum</i>	<i>Pandanus odoratissimus</i>
<i>Arundinaria falcata</i>	" <i>fucatus</i>
<i>Arundo donax</i>	<i>Phoenix dactylifera</i>
<i>Boerassus flabelliformis</i>	" <i>syvestris</i>
<i>Chamaerops Rutchiana</i>	<i>Papyrus pangorei</i>
<i>Cocos nucifera</i>	<i>Phyrium dichotomum</i>
<i>Hedychium spicatum</i>	<i>Saccharum sara</i>
<i>Malocochaete pectinata</i>	<i>Typha angustifolia</i>
<i>Maranta dichotoma</i>	" <i>elephantina</i>

The leaves of the *Pandanus odoratissimus* make a very fine matting, largely employed by cabinet makers as a packing material The leaves of the palmyra are also largely used for the palm leaf books The stalks of *Andropogon muricatum* are used as a thatch grass, and its roots are woven into screen mats called "tatti," which are wetted to cool the atmosphere

In Airacan, there are six kinds of Bast, called "Sha" which might successfully be fabricated into mats In 1854, the price of Russian Mats was £7-10-0 to £8 per 100 wholesale and from 2s to 3s. 6d each,

retail The mats of Bengal, called Sital Patee, are made from the *Phyrium dichotomum* Several species of *Typha*, *Juncus* and *Saccharum*, abound in the Madras Presidency and are applied to useful purposes Many of the mats exported from Calcutta are made from the *Papyrus pangorei* Some of the Burmese mats are made from the split stems of the *Maranta dichotoma*, called "Then" which grows abundantly in the forests of Buimah and the Tenasserim Provinces The large coarse mats in universal use in Buimah, are made from the leaf of a species of screw pine, *Pandanus fucatus* ? *Burm* tha-ban known as the Lowland screw pine in distinction to the "Highland" species of *Pandanus*, which grows on the high lands above tide waters, from which the smaller and finer mats are fabricated Table mats are made by the Chinese very beautifully and the demand for them has increased the importation of rattans within the last few years They are exported to all parts of the world Table mats are put up in sets of six each of different sizes, or else are made and put up to order Floor mats are made of a rush cultivated for the purpose, the best are called Lientan mats They are either plain white, or plain red and white The manufacture of matting for sails of boats and junks employs thousands of workmen, and that for floors, for bedding, and envelopes of boxes and cases, as many more Floor matting is put up in rolls containing 50 mats of 6 by 4 feet, such a roll is estimated to weigh a pecul The annual exportation to the United States is upwards of 10,000 rolls of 40 yards each, at four dollars a roll It is also sent to India and South America, Sydney, &c When matting is shipped, care should be taken that the rolls are perfectly dry, or they will mildew and become rotten Mats made of rattan for table-furniture, and of grass for floors, are largely exported from China The latter is manufactured of different widths and patterns, and though the amount annually sent to the United States and elsewhere is calculated to exceed half a million yards, it forms a very small proportion to the home consumption A sail containing nearly 400 square feet can be obtained for ten dollars The rolls are largely exported and still more extensively used in the country for covering packages, for shipment A stouter kind made of bamboo splints serves as a material for huts, and many other purposes that are elsewhere attained by boards or canvas Rattans are also worked into mats, chairs, baskets, and other articles of domestic service Several branches of manufacture have entirely grown

MATS

up or been much encouraged by the trade at Canton, among which the preparation of vermilion, beating gold leaf, cutting pearl buttons, weaving and painting fancy window blinds, and the preparation of sweetmeats, are the principal

The manufacture of mattings from colored grass has long been carried on successfully in the Madras Presidency, and those from Cochin, Palghat, Tinnevely, and Wandiwash, are in considerable demand, the two former on account of their brilliancy of colors, and fine quality, and the two latter from their extreme cheapness. Several species of grass appear to be employed for mats, some being broad, flat and soft, while others are round, fine and wiry, the mats of Cochin, Palghat and the Western Coast are of the latter description, and are more durable in consequence. The chief defect in this manufacture is that the mats have hitherto been made in long strips which required to be sewed together when a large surface of floor is to be covered. This defect was pointed out to the Local Committee of Cochin, who then contributed two large mats 12 feet x 12 each woven in a single piece of good pattern and harmonious colors. The mats of Tanjore and Tinnevely are creditable.

The plain con matting of Malabar, and the colored red and black matting of Canara, are known. A door mat made of Aloe fibre in Coimbatore is a novel and useful manufacture, but this substance is well suited to the manufacture of rugs and carpets, as it is cheap, strong and nearly white, and can be dyed of the most brilliant colors and manufactured into cloth, damask, and imitation horse hair cloth. The local names of the mats are

In Palghat	Manha Poo Paya
„ Needoongunad	Cooroo Naro Virallee
Palghat	Anjee Pooketty Mookoya Vello
„	Shooyakunden, Vnallee
„	Kolli Mooka Vnallee
„	Ketta Mookya Virolia

Mats are made in the Laccadive Islands, from the cocoanut leaf cut out of the heart of the tree just before it unfolds. These are employed in the islands as sails of ships, they are of fine quality and much esteemed when exported. In the peninsula of India, however, the most common and most generally useful mats are formed of the bamboo, those made with the shining outside strips are used for matting of rooms where the rattan is not procurable. Common bamboo mats are used for lining vessels previous to receiving cargo and for covering bullock carts. Rattan mats are generally preferred for

MATS

rooms, Tonga mats, similar to the Bengal, are prepared in many parts of Southern India, the date, and palmyra leaf mats are generally used by natives for sleeping on and are very useful, the kildara (Mogah) leaf furnishes a good material for matting for packing, the Mauritius sugar bags are made from it, different grasses and rushes furnish material for common mats, and mat-makers stain the mats both red and black—Palghat mats and those from Cochin are considered the finest in Southern India. Mats of Travancore are made from the grass *Cyperus textilis*, and another grass called Cooray.

The mats of Silhet are famed, rich Hindus sit on mats, and have large pillows at their backs, upon which they rest their arms.

The exports of mats from India were as under, chiefly from Bengal and Madras

1857-8	£1576	1869-1870	£2379
1858-9	£2505	1870 - 71	£2094

The internal trade in mats is, however, very extensive, as they are in universal use by both Europeans and natives, and are therefore made of kinds and varieties to suit everybody's taste and means. Europeans use only the better kind of mats, and almost exclusively for the covering of floors in their houses, but natives employ them for a variety of other purposes, such as to sleep upon, smoke, &c. Every mahomedan, however poor, after having performed the prescribed ablutions, spreads a small mat before him, while saying his prayers. The Hindu uses it as a sort of table-cloth, in many a poor hut it constitutes the only piece of furniture perceptible. The finest kinds of the Bengal matting, are manufactured at Midnapore, near Calcutta. These are only manufactured to special order, but can be made of any size required. The price varies according to the size of the border, which is coloured either red or black, and one large mat, 25 feet square, cost at Midnapore 30£. Smaller mats may be valued in proportion. But besides these extremely fine mats, a description is manufactured, of which considerable numbers are exported to Madras, Bombay, Mauritius, and South Australia, these are much cheaper, and a good strong mat, about 20 feet square, may be had for 4£ if plain, and 5£ 10s with a black or red border. The mats next in point of fineness are those from Jessore, also in the vicinity of Calcutta, and called Sittulputtee. These, however, are never made, for India, of the size of an entire room-floor, but only in the shape of rugs, and have invariably a red border, sometimes also a red-flowered centre. They are generally made

about 4 to 5 feet long and 2 broad, and cost from 2£ to 3£ each. At Hoogly, near Calcutta, an inferior kind of small mat is made, of which very large quantities are exported by the emigrants to Mauritius and Demerara, and lately several shipments have been made to New South Wales. The largest variety of small mats is, however, made in the Madras Presidency, North Arcot, and the whole of the Malabar coast, are celebrated for these handsome fabrics. There are at least 200 varieties of design and colouring, the price varying from 3s to 3£ per mat, according to quality and length. All mats in India are made by a special caste, who devote themselves exclusively to that description of manufacture. As everybody, high or low, rich or poor, uses some kind of mat, a very large number of people must be employed in making mats to supply the demand, not only of the immense local population, but also that for export.

A kind of mat is made of rushes, which have been exposed to the sun for three days, when about to be used they are soaked in water for an hour, and then split into thin strips. It is made more or less fine, according to the quality of the mat required. If the border of the mat is to be coloured, the rushes are dipped into a red dye to the necessary depth. This process of manufacture consists in plaiting the rushes thus prepared on threads tightly strung between two bamboos, a sley being used, as in weaving, for compressing them tightly together. The finest kind of mats take from one to six months to manufacture, both the time occupied and the cost depending on the size required. Small mats are much used by the natives, but of an inferior and cheaper quality. Mats of this kind are exported largely to Calcutta and they can be made of any pattern, Price up to 300 Rs.

In North Arcot, in 1862, there were sixty-three mat weavers in Wandawash, six of whom are reported to be skilful workmen. The reeds or grass of which these mats are made grow in kasba Wandawash, on a kam of land, which is situated in the vicinity of a tank. They are also largely cultivated in Palakonda, Pondicherry, and Cuddalore in the South Arcot District, on river banks or river poramboke, &c. At Wandawash a kam of land would yield a produce of two bandy-load of grass, if the season be favorable. The price of a bandy-load at Palakonda is 30 Rs, exclusive of the bandy-hue thence to Wandawash, viz 7 Rs or thereabouts. A superior kind of mat grass is to be had at Velani, Tanjore District, but the charges are so heavy that they prohibit import—*Re-*

MATSYA, the Fish Avatara, of the hindoo god Vishnu, has been demonstrated to have immediate reference to the general deluge, and to be the same history, disguised in oriental fiction, of that event, as is related in the Hebrew scriptures, Sir W Jones assents to the opinion of Bochart, that the fable of Saturn was raised on the true history of Noah. He shows that the seventh Menn, Satyavata, corresponds in station and character. In his reign, the Hindus believe the whole earth to have been destroyed by a flood, including all mankind, who had become corrupt, except the pious prince himself, the seven rishi, and their several wives, who, by command of Vishnu, entered a bahitia, or spacious vessel accompanied by pairs of all animals. Vishnu, assuming the form of a fish commanded the ark to be fastened by a cable, formed of a vast serpent, to his stupendous horn secured thereby until the flood subsided, when he and Brahma slew a monster, named Hya-griva, who, while Brahma was reposing at the end of a kalpa, stole the Vedas, and mankind had consequently fallen into the depths of ignorance and impiety. This mighty demon is called the prince of Danava a name which means horse-necked. The Vedas having been recovered, the world was progressively re-peopled with pious inhabitants, descendants of the devout Satyavata and his favoured companions. The history of this avatara is the subject of the first Purana, or sacred poem, consisting of 14,000 stanzas, and is concisely told in the eighth book of the Sri Bhagavata, or life of Krishna—*Sir W Jones Asiatic Researches, Vol I*

MATSYA, a country which produced fish, sometimes said to be Bengal, sometimes Guzerat. The hindu races who worship in addition to the works of their own hands, so many varied products and so large a number of mammals and reptiles do not, seemingly, worship fish. In their religion, the Matsya Avatara is the Fish Incarnation of Vishnu, in which he preserves a king named Manu, with the seeds of all things in an ark, during the deluge, which happened in order to kill Somukasura who had stolen the Vedas, and hidden them in the Sea. A tank or pond

MATULUNGA

with all its contents may however with the hindus be devoted to a deity, and Col Tod mentions that when one day he had thrown his net into a lake, which abounded with a variety of fish, his pastime was interrupted by a message from the regent, Zahim Sing, to tell Captain Tod that Kotah and all around it were at his disposal, but these fish belong to Kaniya. On which, Colonel Tod immediately desisted, and the fish were returned to the safeguard of the deity. In such a sacred tank, fish will feed from the hand, and in the Mahamaddy, where it is three miles broad, he tells us, fish will follow for miles for a little burnt rice — *Tod's Travels*, p. 9

MATTANDA The most impressive and the grandest ruins in Kashmir, no Mattand, about three miles east of Islamabad. This temple has been the subject of much controversy in respect of its age and dedication, but General Cunningham believes that the dedication was to the sun, Mitam being but a corruption of the Sanskrit, Mattand or the sun, mention is made of it in the *Raj Tarangini*, translated by Mr Troyer, "Il construisit aussi dans le village Simharotsik un sanctuaire au soleil, lequel sous le nom de Ranapuraswami, acquit une renommée répandue partout." M Troyer, however, expressly declares in his translation, that the temple was dedicated to the sun, General Cunningham believes that two different edifices were indicated in the above verse, first, the temple of Ranapmaswami, dedicated to Siva, and second, the temple of Mattand, mentioned by the *Raja Tarangini* as that surrounded by a colonnade

MATURA on the east coast of Ceylon, in lat 5° 58' N long 80° 37' E is a considerable town with a fort

Many gems have been, from ancient times, exported from Ceylon, where the ruby, amethyst, topaz, sapphire, spinelle, chrysoberyl, cornudum and cinnamon stone are found in great abundance, but not emeralds. The sapphires which are red, purple, yellow, blue, white, and star-stone, are met with at Matura and Saffiagam, and rubies and sapphires at Badulla and Saffiagam. The white Tourmalin, or Maturase Diamond, called in Singhalese, Suda Turmah, is a topaz of a pale yellow colour.

The Zircon family is richer in Ceylon than in any other part of the world. It is found in the districts of Matura and Saffiagam, and is most abundant in the former. "Matura diamond" is the name applied to its finest varieties by the dealers in gems. Besides the two well-established species, common zircon, and hyacinth, there is a third, massive opaque, and uncrystallized, and of a dark brown colour. Specimens of it from Saffiagam weigh two or three ounces. The yellow varieties are sold by the natives as a peculiar kind of topaz, the given as tourmalines, the hyacinth red, as inferior rubies, and the very light grey, as imperfect diamonds. All the varieties are found in the beds of rivers, or in alluvial ground, which, both in Saffiagam and Matura is of the same kind — *Horsburgh's Travels*, Vol IV p. 219

MAUN BHOW, a sect formed by Krishna Bhat. They revere the sacredness of the Vedas, but deny that of the Puranas and Gita. The sect are hindu mendicant devotees, who worship Krishna. They are readily recognised by their black clothing. Brahmins assert that the first of the Maun Bhow was the son of a brahman by a Mang woman, but the sect claim a fabulously far descent from the beginning of the world. Their chief locality is in the country between the Syhadri hills, and the east Goud country on the east of Berar, and between the Kistna river and Malwa. A few are to be found in the Punjab. They dwell in mat'hs, the chief mat'h being at Rudpur near Ellichpur, Oomarkher. They resemble in their relations, some of the Christian monks. They are believers in Krishna, as his life is detailed in the Bhagwat or eighteenth Purana, and they reject all other hindu shastras and do not worship other hindoo gods.—*Capt Mackintosh in No 10, Jan 1836, M J L & S*

MAUNBHOOM and Singhbhoom, are districts in Chota Nagpore. The mortality from the famine of 1866 fell on the population about the same as in Orissa.

MAUND, or MAN, a measure of weight of India, which varies from 25 lbs to 82½ according to the substance weighed. The Bengal Bazaar Maund is 82 lbs 2 oz avoirdupois, Goods weighed or passed by viss are converted at the rate of 365 lbs avoirdupois per 100 viss. Grain shippers declare their own weight. At Ispahan, the shah or royal man, is always used, instead of the Tabreez man employed at Sheraz. One Shahi man is equal to two Tabreez man. A khuiwai or ass's load, is estimated at a hundred man Tabreez, or about 725 lbs English.—*Fraser's Journey into Khorasan*, p 369. See Man

MAURYA a dynasty of Magadha, founded by Chandragupta the Sandracottus of the Greeks, but which was swept away in the middle of the 5th century. Chandragupta, was the illegitimate son of the last Nanda by the beautiful, but low caste, Mura, from whom he obtained the designation of Maurya. In the Mudra Rakshasa, a Sanskrit drama detailing his elevation, Chandragupta is frequently named Vishala, a term said to be equivalent to Sudra, and as Nanda himself was the son of a sudra woman, there can be little doubt that the celebrated Maurya family were of sudra extraction. The Gautama were followed by the Maurya, a family consisting of nine princes. The last of the Maurya is stated to have been attacked and slain by the rajah of Kamayun, named Sakaditya, or Lord of the Saka. See

MAYA, with the hindoo, morally means nothing more than the nothingness of this world, poetically, the inability of man to appreciate the world in which he lives, and philosophically, it is identical with the idealism of Bentley. On Maya or Illusion, Brahma says, in this life, man, as in a dream, finds delight in eating, drinking, and other enjoyments, but as soon as he awakes they yield no longer pleasure, for the joys and pleasures of his life are as unreal as

MAYI

dreams. By devout abstraction (that is, by meditating on God) man awakes to a knowledge of divine truths, and finds his former enjoyments nothing but illusion. Thus, a supreme eternal Spirit, the Creator of all, pervades all, and will finally destroy all, in fine, all things are Maya which do not proceed from the light of divine knowledge. By the vaishnava, Laksmi is called Maya, or Ada Maya — The inextricable difficulties attending the vulgar notion of material substance concerning which

"We know this only, that we nothing know"

induced many of the ancients, and some moderns, to believe that the whole creation was rather an energy than a work, by which the infinite Being, who is present at all times, in all places, exhibits, to the minds of his creatures a set of perceptions like a wonderful picture, or piece of music, always varied, yet always uniform, so that all bodies and their qualities exist, indeed, to every wise and useful purpose, but exist only as they are perceived. This illusive operation of the deity the hindu philosophers call Maya, or Deception — *Mon, p 73 Cole, Myth Hind p 389 See Kama*

MAZANDERAN, is a province of Persia, lying on the southern shore of the Caspian Sea It is very mountainous and rich, and the mountains are, with the exception of those in Georgia, the only ones in Persia covered with forests, principally composed of the Azad-Darakhit or Persian teak-tree, admirably adapted for ship-building This fact made Peter the Great and Catherine II so anxious to obtain possession of Mazanderan, and the neighbouring province of Ghilan, and indeed they were ceded to Peter by treaty at one moment, although he was afterwards obliged to relinquish them Down to the middle of the nineteenth century, the Russians never ceased their efforts to gain even a small footing in this neighbourhood, and they succeeded in obtaining and fortifying the small island of Ashonnada close to the shore in the neighbourhood of Asterabad Mazanderan, in pre-historic times, is said to have been conquered by Roostam, who is said to have killed there a number of elephants, an animal now unknown in Persia The net revenue of Mazanderan are 22,132 toman 8,740 dinars Mazanderan, as well as Ghilan, may be divided into two distinct climates, the warm and the cold, namely, the mountainous region, and the flat country along the shore of the Caspian Sea Winter and spring are the healthiest seasons, for the summer and autumnal heats occasion such exhalations to arise from the fens and marshes which overspread this part of Persia, as to render the air most insalubrious Agues and dropsies are the prevalent disorders, and the natives have in general a sallow and bloated appearance, indicative of the state of their health In October, November and December, there are heavy rains Snow also falls, but never lies long upon the ground, and in spring the rivers, almost invariably overflow The small province of Asterabad is sometimes included in Mazanderan, which it resembles in appearance, climate and productions This is the ancient Hyrcania, and the paternal estate of the king of Persia, as chief of the Kajar tribe who have entire possession of the province It is bounded on the West by the Caspian Sea, to the South it is separated by a lofty ridge of mountains from the districts of Damgan and Bistan, it extends to the East as far as the Longitude of 58° , and is divided from Dahestan by the river Ashoi The city of Asterabad, the "capital of the province, is

McMURDO

situated near the mouth of the river Euxine, on a bay of the Caspian sea "

MEASURES.

Mr W H Bayley of the Madras Civil Service, when a Member of the Board of Revenue, in 1857, in a memorandum on the land measures of the Madras Presidency, remarked that the 'Lineal' measure of India, is almost everywhere founded on the length of the human fore-arm, called in Hindustani *hath*, in Tamil *moolum* and in Telugu *moora*. It is said to be the length from the elbow joint to the tip of the finger of some tall man chosen as a standard. The term is translated *cubit*, but it invariably exceeds the 18 inch cubit of England. Major Jervis in his work on Indian Metrology, assumes the Indian cubit at 19.55 English inches, and in the Madras Presidency it averages about 19.7 inches, varying from $19\frac{1}{4}$ to 20. In the southern part of the Presidency the Tamil word *adee*, translated *foot*, is known as a lineal measure, this also is said to be the length of the foot of some tall man, and averages $10\frac{1}{4}$ inches. The ancient lineal measures of the Egyptians, and the Jews, and Greeks, were taken from a unit representing the human foot or arm. The "cubit" was, as in India, the forearm, i.e., from the elbow joint to the tip of the long finger. The cubit was sub-divided into two "spans," or six "hand-breadths," (palms) or 24 "finger-breadths" (digits). The Jewish "Rod" was six cubits. Several values have been assigned to the Jewish cubit, varying from 20 to 21 English inches, so that it assimilated very closely to the Indian cubit.

The *guz* translated *yard*, is known all over India, but perhaps not so extensively as the cubit. It is supposed to have been introduced by the mahomedans, but on what standard founded, is not known. It varies exceedingly in different localities, and in the same place its length sometimes varies with the length of the article measured. The *guz* of Akbar, called the *Illahae guz* was introduced by him into Northern India in the 15th century, and was equivalent to $33\frac{1}{2}$ English inches. The British Government however, fixed on 33 inches for the standard *guz* of the North-West Provinces. In Bombay the *guz* is about 27 inches, and in the Madras Presidency varies from 26 to 39 inches. It is, however, very much superseded by the English yard measure. In the districts of Madura and Tinnevely, the *Tutchu-hole* or Artificers' stick is 33 English inches.

In the South of India the *Guz* is sub-divided into 24 *ungoolum*, each of which, taking the Tanjore *guz* of $33\frac{1}{2}$ inches, is $\frac{1}{16}$ of an English inch. The term *ungoolum* in

MEASURES

Tamil signifies the thumb, and in the above measure, it is the distance from the thumb joint to the tip of the nail. This *ungoolum* is considered equal to 2 *vurul kuddei*, or finger-tip-breadths.

The term 'ungoolum' is however sometimes used to mean a thumb-breadth, and is then the same as the *vurul kuddei* or finger-breadth or digit, or the 24th part of a cubit (about 82 inch) according to the following Table,

4 Fingers' breadth	— 1 Palm
12 Fingers' breadth	= 1 Span
24 Fingers' breadth	= 1 Cubit
4 Cubits	— 1 Fathom

The *Tutchu-moolum* or Artificers' cubit (double) of Trichinopoly is 33 inches, or the same as the Tinnevely *Tutchu-hole*, and is sub-divided into 24 *ungoolum*.

The *bam*, translated *fathom*, in Salem and Coimbatore averages 6 feet $4\frac{1}{2}$ inches, and in Guntur 6 feet $6\frac{3}{8}$ inches. It is generally, but not always sub-divided into 4 cubits. The *bam* or fathom is also used by Native Seamen, on the lead line.

For distances of greater length, there is no defined measure in Southern India. A *nali-vulli* in Tamil, is derived from *vulli* a road or way, and *nali* a period of time which is the 60th part of the 24 hours, or 24 English minutes, generally known as an "Indian hour." The distance that is usually walked in this time is called a *nali vulli*, and is about $1\frac{1}{2}$ English miles or somewhat less. Seven *nali-vulli* make a *ladum* of about 10 miles.

The *coss* is generally considered 2 English miles, but according to Colebrooke as follows

4 Cubits	1 Danda or Staff
2,000 Danda	1 Coss

Taking the cubit at $19\frac{1}{2}$ inches, the *coss* would be 2.46 miles.

In Southern India, it appears to have been the custom in ancient times to name an area of land after the quantity of grain, that it was thought would sow it, or the quantity it was thought it would produce. Thus, for instance, a candy of land was as much as would produce a Candy of grain, and this was by estimate, and not by actual measurement, or if a measured area was considered a Candy in one village, it would not be so in the next. Even where there is some defined superficial measure, commencing from a *rod* square, the number of cubits to the *rod* varies, though the term by which the square *rod* is known is the same.

In some districts of the Madras Presidency the land-measure is well defined, as in the case of the Cawrie, and the Acre. The

former no doubt formerly differed in different places, but its dimensions seem to have been determined and introduced by Royajee the celebrated dewan of Mahomed Ali (Wallajah) nawab of the Carnatic. Wherever the Cawnie exists, it is now 57,600 square feet, or .1322314 acres, except in some of the talooks of Trichinopoly. The English Acre was introduced by Sir F. Munro into Bellary and Cuddapah, during the Survey (so called) of 1802-1806, and 1842 it was introduced on a similar occasion into Kurnool. Unfortunately in both cases the chain of 33 feet was used instead of Gunter's chain of 66 feet, so that the square chain was $\frac{1}{16}$ th acre, thus introducing an awkward sub-multiple, (not more so however than the rood and perch) when a very simple decimal sub-division might have been adopted.

Some confusion has occasionally occurred from the use of the term *cubit* in English correspondence. It is constantly assumed to be the English cubit of 18 inches, and on one occasion a whole series of Tables of Land Measure in a District, which had been officially sent forth as correct, had to be revised and altered throughout, in consequence of this error.

The term *goonta* or *coonta* also is another word which has often given rise to mistake. It is synonymous with *coolee*, and *goolee*. The word seems to denote the land measure next below the maximum of the place, thus the *pooty* of Rajahmundry, the *catty* of Masulipatam, the *coatchel* of Guntoor, the *goortoo* of Nellore, the *cawnie* of Chingleput, the *acre* of Bellary and the *mow* of Tanjore are all sub-divided into goonta (coonta) or coolee, (goolee). The goonta, &c, of one district, is not at all necessarily the same as the goonta, &c of another.

Not only is there a perplexing variety in the native Land Measures, but it is well known that the areas are not even what they profess to be, the rod or rope being seldom or ever the number of cubits it is said to be. Considering therefore that in the Madras Presidency, where the Ryotwar system of assessment generally prevails, it is a vital point to have on record the exact size of every field, and a new Survey seems almost indispensable. It will then be a question what kind of Land Measure should be introduced? That of the Cawnie would perhaps be most acceptable to the people, but there would be little difficulty in introducing the English acre. This has already been done in Bellary, Cuddapah and Kurnool, and in a good part of Guntoor. In Salem, though the original measurements were in native *goonta*, and *bullah*, the accounts have long

been kept in acres, according to Tables of Conversion prepared many years ago, and the extent of each Ryot's holding is stated in his puttah in Acres. In the late Bombay Survey the Acre was introduced, and in the North-West Provinces the areas of the villages are recorded in acres, though the *fields* were measured in local *beegas*.

An Act was passed by the Governor General of India in Council in October 1871 with a view to provide for the ultimate adoption of a uniform system of weights and measures of capacity throughout British India. The Act directs that the unit of weight shall be a "ser," equal to the French kilogramme, and the unit for measures of capacity, a measure containing one such ser of water at its maximum density, weighed in a vacuum. Other weights and measures of capacity to be authorized under this Act are to be integral multiples or sub-multiples of these units, the sub-divisions to be expressed in decimal parts unless otherwise ordered. When proper standards have been provided for verification of these weights and measures to be used by any Government office, municipal body, or railway company, the Governor-General in Council may direct that the weights and measures so authorized shall be used in dealings by such office, body, or company. The local Government may prepare tables of the equivalents of other weights and measures in terms of the weights and measures so authorized.

Mr Charles E. Gove of Madras, who has published a valuable book on the Indian weights and measures, remarks that the unit of weight now commonly employed is the tola, which, according to the official regulations upon the subject, should be 180 grains in weight. It is the rupee, and was adopted from its fancied quality of giving everybody the power of testing his own purchases. Nevertheless, in the following localities, the tola thus varies in grains

Ahmedabad	193 44	Konkan	186 8	Salsee	191
Ahmednager	188 4	Do	188	Do	194
Aurangabad	187 5	Do	191 6	Sattara	172 5
Arowlee	182 8	Madras	182 29	Sauksee	195 4
Do ..	191	Malwa	190	Do	184 8
Belgaum	176 25	Malwan	186	Soowurn-di-oog	193 2
Bombay		Nizam-poor	180	Surat	187 2
(for oil)	191	Nujunwell	190 5	Do	178 3
Guzerat	183 5	Patna	209	Sulra	178 7
Do	175 9	Rajpoo-ree	177 5	Vijydioog	186 6
Gosala	178	Rutnagur	186 2	Vingorla	186 6
Jaulnah	184 5	Do	187 8	Do	181 3
		Eyghurh	187 3	Wurad	186
		Do	184 8	Do	185 6

Next above the tola comes the seer, a weight universally employed throughout every corner of India. It is based upon the tola, of which, according to the Bengal new scale,

MEASURES

it ought to contain eighty. In practice it may be any number of tolas from 24 to 140, and these of any of the hundreds of kinds just described. As it thus were not enough, "the seer," in the words of a Government order, 'is liable, according to the pernicious system hitherto prevalent, to vary in weight for every article sold as well as for every market.' Thus in Bombay, butcher's meat is sold by the seer of 26 tolas, arrack and milk by the seer of 56 tolas, while drugs are sold in seers of 24 tolas, and cotton, in seers of 26. Yet other articles are sold by the seer of 27½ tolas. On one side of the little river that enters the sea at Goa, the seer employed in wholesale dealings is of 28 tolas, while on the other side, it contains no less than 72. In Calcutta, some articles are sold by the seer of 80 sicca rupees, while for others, the seer is 80 current rupees. If we travel through the districts immediately surrounding Calcutta, we shall find in Hooghly, seers of 51, 80 and 82 tolas. In Nuddea, 82½ tolas make the seer, in Pubnah, 58 and 60, in Binchorah the grain seer is 98 tolas for merchants, while, retail, it is but 62. In the Beerbhoom bazar the ordinary seer is 58½ tolas, for one article it is 60, while for the commoner metals it is 72. The planter in Tinhoot when he makes his purchases in the bazar, cannot tell whether his seer shall be of 48, 52, 76, 80 or 88 tolas, for all are used. At Kurnickanad, it may be either 80, 82, 90, 96 or 112 tolas. At Aringh, cotton is weighed by the seer of 80 tolas, ghee and salt by the seer of 95, corn in retail transactions by the seer of 96, while in wholesale purchases, the seer contains either 105 or 108 tolas. Behar has a seer weighing either 14, 18, 52, 72, 76, or 78 tolas, effectually preventing any one from making a purchase out of the village in which he was brought up, and whose seers he is acquainted with. Bhagulpore, with an almost endless variety of its own—61, 67, 80, 88, 101 and 10½ tolas—has not one to correspond with any one of the Behar measures. The province of Malda, contains seers varying in the following proportions—50, 58, 60, 72, 75, 76, 80, 80½, 91, 92, 94, 96, 100, 101 and 105 tolas. In Calpee, cotton is sold by the seer of 75½ tolas, and rice by measures containing 66 tolas when the transaction is wholesale, while if it be retail, they contain 80 tolas. The full benefits of the irrigation works in Cuttack, can never be obtained, while the seer varies from 26, 40, 52½, 65, 87½ to 150 tolas. In Madras the seer for meat is 2½ lbs, for merchandise it is 3½ lbs, while for copper it is but 10 ounces, while that employed by Government is 3 lbs 1 oz. 5 94 diamis

MEASURES

Above the seer, and equally universal is the man, maund, or phara, which in Madras is 25 lbs, in Bombay 28, and in Calcutta, 82½ lbs. The Bombay Mercantile News, in its price current of exports for 21, December 1864, contains the following maunds, in addition to the official maund of 28 lbs, for

Cardamoms	37 5 lbs	Hemp	30 8 lbs.
Cotton	39 2 "	Mocha Coffee	41 06 "
Ginger	29 1 "	Munjeet	41 "

and besides there is another maund of 29 4 lbs. In Bengal, the factory maund is 74½ lbs. The coasting steamers on the Western coast start from Travancore with maunds of 32 lbs, deal at Calcut in maunds of 30 lbs, but ship coffee that has been sent down from Wynad, in maunds of 25 lbs but of 28 lbs if from Mysore. At Cannanore, the maund is 25 lb. At Bombay, the current maund is 28 lbs, into which before shipment all molussil shipments have to be transferred—if Poona goods, from maunds of 78 8 or 90 lbs, if Ahmednuggur productions, maunds of 80 or 163½ lbs, must be thus reduced. Sattara shipments must be charged from maunds of 152½ lbs. Perhaps the next port will be Surat, where the maund may be either 31, 33, 39, 41 or 44 lbs. The end of the journey will probably be Kurrachee, where the puzzled supercargo must deal in maunds of 80 or 83½ lbs. At Deesa, the value descends to 10½ lbs, and at Rajcote to 11 lbs.

Measures of length. The popular unit of length is the gnz. Everywhere its use is habitual. It will probably be seen that it is not only the unit of length but is intimately connected with the units of weight and capacity.

It may be anything between 15 and 30 inches, but is, in nineteen cases out of twenty, between 18½ and 21 inches. The popular cubit in Beerbhoom is 15½ inches in length, although the Revenue survey employs a cubit of 18½ inches. In the Hooghly district, the cubit varies from 18 to 19½ inches, while in Pubna it may be anything between 17 and 30 inches, at Sarum it is 24 inches in length, while in Broach, Kara and Veejdroog, it is respectively 19 2, 19 4 and 19 58 inches. The following table will exhibit in a condensed form, a few of the variations—

	Inches		Inches
Bhagulkota	19 25	Hingalz	19 2
Belgaum	19 25	Jumboseer	19 4
Beerbhoom official	18 8	Do	12
Do usual	15 75	Kara	19 44
Broach	19 2	Do	19 44
Chupleon	19 667	Kupurwing	19 1

Rajpoores	19 32	Do	19 58
		Wurid	19 803

MEASURES

these groups are present in one locality for different transactions. Merchants will buy by the guz of 34 inches, and sell by that of 30, or silk will be measured by one, cloth (cotton or woollen) by another, while carpenters and bricklayers will use each a distinct measure. For instance, cotton cloth in Surat is measured by the guz of 27 8 inches, silk and other valuable stuffs by the guz of 34 7 inches, while the carpenter employs a guz of 27 2 inches. At Jaunpore, the carpenter values his guz at 30 inches, the tailor estimates his at 34 inches, while the cloth seller employs one of 40 inches. The muslin seller at Furruckabad uses a guz of 33 1/4 inches, the cloth-seller one of 34 inches, while the seller of silk for turbans and full dress coats, uses no other than 38 1/2 inches. Similar cases might be adduced in infinite abundance. Wherever the cubit varies, the guz follows, usually in the proportion of 12 to 7, though this is by no means an invariable rule, and its lengths are as under:

Agia	In	Furruckabad	
Do	33 25	tissues	15 fingers.
Do	32 8	Do cloth	16 do
Ahmedabad		Do col-silk	17 do
cloth	27 75	Do cloth	16 do
Do velvet	31 25	Do land	31 1/2
Do ribber	23 33	Ghazeerope	31 1/2 inches
Ahmednugger	21 5	Guzerat stuffs	31 7
Allyghur	30 5	Haveri	34 75

The cubit and guz will suffice to prove the imperfection of Indian measures of length, and we therefore turn to square measures, in which the beegah is the most widely-spread standard. It is based upon the guz or cubit, and therefore differs in at least an equal proportion.

Beegah, would seem to imply a de-

MEASURES

finite area, and must have done so at some period. However that may be, there is no such measure now, the name being applied to any decently large area, varying from an acre to 1,500 square yards.

In Calcutta, the value is said to be 1,600 square yards, while according to a very careful calculation made by Mr. Holwell of Black Hole notoriety and quoted by Major Jervis, the real content should be 1,778 square yards, more than ten per cent greater than is commonly believed.

In Orissa, to the south of Calcutta, the beegah is 4,840 square yards while in Bahar to the west, it is only 3,025 square yards. In Tirhoot, it may contain amongst other values, any one of the following quantities—3,025, 3,567, 3,600, 4,225, 4,549 and 4,900 square yards. Such a measure, can only be of use to confuse. At Saharunpore, the beegah contains in one village $824\frac{1}{2}$ square yards, in another 2,317 square yards, in a third 2,456 square yards, while in a fourth it contains 2,756 square yards. In Nuddea, it may contain either 6,400 or 3,025 square cubits. The Bogoriah beegah is $1,406\frac{1}{2}$ square yards, while that of Delhi is 3,025, and that at Ghazeeপুর contains $2,755\frac{1}{2}$ square yards. At Shahjehanpore it may either be 2,916 or 3,600 square yards, while at Hoshungabad it is $4,865\frac{1}{16}$, and at Benares 3,136 square yards. On the western side of India, the variations are equally numerous. At Broach the beegah contains 2,477, at Surat 2,844, in other parts of Guzerat 2,994, while in the East it contains no less than 4,013 square yards.

Measures of capacity, in the greater part of India, do not exist independent of the measures of weight. The maund and seer measures of capacity, are supposed to represent the equivalents of a maund and seer weight, although it is evident, since no two articles have exactly the same proportionate bulk, that no two measures need correspond. In the absence of suitable standards of capacity almost every article is sold by weight, even ghee, oil and milk. Grain is sold either by weight or measure, but with an understood proportion between them, thus in Madras, the "measure" for paddy is exactly the bulk of a "viss" weight, and is therefore but another example of the use of the equivalent of a weight as a measure of capacity. Where independent measures are employed, they usually follow the same rule as those of length, weight and area, and are of every variety. There are however a few measures of a well ascertained value, which appear to have been arranged in something like order

MEASURES

around the cubic cubit. An old writer on arithmetic, Bhaskur Acharya, states explicitly that a measure called *kanika* was the cubic cubit or *ghunuhustu*. Above this was the cube of a double cubit, and ten times the half of this is the *garce*, a measure well known through all Southern India and formerly universal, so that the *garce* is 40 *kanika*. The half of the *kanika* is the *parah*. One-tenth part of the cubic cubit is the *mercal*. In Western India, there is the candy of 10 cubic cubits. The cube of one-fourth of a cubic cubit is the *Pylee*. In Southern India, there is the *Tumi* of four hundredths of the *garce*, and the *Paddacu* or one-fifth of the cubic cubit, while in the Telugu districts there is the *Pootee* of two cubic cubits, and another *Tumi* one-tenth of one cubit. Turning northwards to Ganjam we find the *Burnum*, of two cubic cubits, and the *Nawty* of one-tenth of a cubic cubit, and the *Toom* of one-fortieth of the same measure.

On the other side of India in Bombay, there is the *khundee*, exactly corresponding with the *garce*. The cube of half the side of the *garce* or the half of the cubic cubit is the *parah* of the same value as in Southern India, while the cube of one-fourth the side of the *parah* is the *seer*. In Malwan the *Khundee* is greatly altered in value and becomes ten cubic cubits, proving that there is an understood connection between the cubit and measures of capacity, in the same district is the *Phura* of half the cubic cubit. As an official recognition of the relation between measures of capacity and the cubit, it ought to be mentioned that when the government of Bombay ordered that the measures for salt throughout the Concan should be rendered uniform, it was resolved to employ a *Phara* of exactly half a cubic cubit, estimated at 195 inches. Reducing the measures referred to into a table, we find the following—

Madras <i>Garce</i>	40 cubic cubits
Malwan <i>Khundee</i>	10 do
<i>Pootee</i> or <i>Burnum</i>	2 do
<i>Ghunuhustu</i>	1 cubic cubit.
<i>Mercial</i>	$\frac{1}{40}$ do
<i>Toomi</i>	$\frac{1}{16}$ do
<i>Nawty</i>	do do
<i>Toom</i>	$\frac{1}{40}$ do

We see here two kinds of division besides the ordinary one of halves and fourths

10 <i>mercals</i>	1 cubic cubit	
	10 do	1 <i>Khundee</i> .
Cube of $\frac{1}{4}$ side of cubic cubit	=	<i>Pylee</i>
Do do do		<i>Parah</i> — <i>Seer</i>

If we compare the lengths assigned to the cubit, in different parts of India omitting

one or two of the smallest and plainly diminished cubits, we shall find the average to be from 19.5 to 19.7 inches—*Bayley Gover*

MEBA, BENG *Anona squamosa*

MECCA, a city in Arabia, the holy city of the mahomedans. It is situated in a dry and barren tract of country, a full day's journey from the sea port town of Jedda. A few leagues beyond it, near the highlands, abundance of excellent fruits is to be found. In the summer months, the heat at Mecca is excessive, and, to avoid and moderate it as much as possible, the inhabitants carefully shut their windows and water the streets. There have been instances of persons suffocated in the middle of the streets by the burning wind called samoum or samiel. The most magnificent part of the sacred city are the arcades around the square in which the Kaba stands. In the Kaba is one singular relic, which is regarded with extreme veneration. This is the famous black stone, said to have been brought by the angel Gabriel in order to the construction of that edifice. The stone, according to the legend was, at first, of a bright white colour, so as even to dazzle the eyes at the distance of four days journey, but it wept so long, and so abundantly for the sins of mankind that it became at length opaque, and at last absolutely black. This stone, every mahomedan pilgrim must kiss, or at least touch, every time he goes round the Kaba. Neither the stone of Abraham, nor that of Ismael, receive the same honours, pilgrims are not obliged either to visit or to kiss them. The Arabs venerate the Kaba, as having been built by Abraham, and having been his house of prayer. Within the same inclosure is the well of Zamzam, valued for the excellence of its water, and no less for its miraculous origin. Hagar, when banished by her master, set little Ismael down here, while she should find some water to quench his thirst. Another ornament of the Kaba, is a row of metal pillars surrounding it. The mahomedans have such high ideas of the sanctity of Mecca, that they suppose it to extend even to the environs of the city. Its territory is reputed sacred to a certain distance round, which is indicated by marks set for this purpose. The Hajar or black stone has suffered from the iconoclastic principle of mahomedanism, having once narrowly escaped destruction by order of the ruler of Egypt. In these days the metal rim serves as a protection as well as an ornament. The height of the Hajar from the ground, according to Captain Burton's measurement, is four feet nine inches, Ali Bey places it forty-two

inches above the pavement. Its colour is now a deep reddish brown, approaching to black. Every person, it is assumed, should perform the pilgrimage to Mecca who has a beast to ride upon, and who can supply himself with provisions for the journey. Ul Shaffer says, those who have money, if they cannot go, should perform this journey by deputy. Malik thinks all who have strength sufficient should go to Mecca. But Ul Hancela deems both money and health of body requisite before this duty can be deemed obligatory. On the day of pilgrimage the preacher sits on a camel, because the prophet, during his last pilgrimage being sick, made the tour of the Ca'aba on his camel, and remained on it while he preached. Arafat (recognition,) is so called, because Ibrahim, the patriarch, after the vision in which he was commanded to sacrifice his son Ishmael, wandered about for a day in perplexity, as to whether the order came from God. On the second day, being at Arafat he had a second vision, and he then recognised, &c. arafa, its truth. In Mecca immorality is conspicuous and the pilgrim may often apply to himself the words of Umm-ibn-Ali Rabiha, on his return from Mecca,

I set out in hope of lightening the burden of my sins
"And returned bringing with me a fresh load of transgressions."

The population of Mecca, is about 18,000. Ali Bey (A. D. 1807) calculates 83,000 pilgrims, Burckhardt (1811,) 70,000. Burton reduced it, in 1853 to 50,000, and in A. D. 1854, owing to political causes, it fell to about 25,000. Of these, at least, 10,000 are Meccans, as every one who can leave the city does so at pilgrimage time. The Arabs have a superstition that the numbers at Arafat cannot be counted. A visit to the Masjid El Nabawi, and the holy spots within it, is technically called "Ziyarat" or Visitation. The visitor, who approaches the Sepulchre as a matter of religious ceremony, is called "Zai," his conductor "Muzawwi," whereas the pilgrim at Mecca becomes a 'Haji.' The Masjid El Nabawi, or the Prophet's Mosque, is one of the Harams, or the "two sanctuaries" of El Islam, and is the second of the three most venerable places of worship in the world, the other two being the Masjid El Haram at Meccah (connected with Abraham) and the Masjid El Aksa of Jerusalem (the peculiar place of Solomon). And curious to say mahomedans still have the largest cathedral in the world—St Sophia's at Constantinople. Next to this ranks St Peters at Rome, thirdly the Jamma Masjid or Cathedral of the old

MECCA

mahomedan city of Bijapoor in India, the fourth is St Paul's, London. It is to El Wahd the Fust (A H 88) that the Saracenic mosque-architecture mainly owes its present form. As will be seen, he had every advantage of borrowing from Christian, Persian, and even Indian art. From the first he took the dome, from the second the cloister—it might have been naturalised in Arabia before his time—and possibly from the third, the minaret and the prayer-niche. The latter appears to be a peculiarly hindu feature in sacred buildings, intended to contain the idol, and to support the lamps, flowers, and other offerings placed before it. Mecca, has as many as twenty-nine designations, such as Om-el-Kora (Mother of Towns), Balad-el-Amin (Region of the Faithful). The city is chiefly situated in the wadi of the same name, which is also called Bekka, a narrow sandy valley which runs north and south, but inclines towards the N W at the latter extremity of the town. The city, with the exception of three castellated buildings and a few watch-towers, is defenceless. Around are several sandy wadi, which are separated from the desert by a low barren chain of hills from 200 to 500 feet in height, the most elevated part of which is on the eastern side. When compared with other places in the east, Meccah may be considered handsome. The houses are built of stone, usually three stories high, with terraced roofs surrounded by open parapet walls, and having the unusual addition of numerous windows, shaded by lightly formed reed blinds, the aspect is more European than oriental, especially as the streets are very wide, in order to afford the necessary space for an addition of about 100,000 to the permanent inhabitants, who are between 25,000 and 30,000 souls. During the pilgrimage, the town is enlivened by well-stored shops in every quarter, and the city becomes an immense fair, in which coffee, myrrh, incense, and other products of Arabia, are exchanged for the richest and most valuable commodities of Persia, India, and Europe, to the amount of several millions of dollars. The appearance of the city, at other times, is sombre, no trees or gardens cheer the eye, and there are but few khans, baths, scrais, or even mosques. There are but few cisterns for collecting rain, the well water is brackish, and during the pilgrimage sweet water becomes an absolute scarcity. At other times the city is chiefly supplied by a conduit coming from the vicinity of Arafat, a distance of six hours journey, this extensive work was constructed by Zebeyda, wife of Harun-ur-Rashid.

MECHI

In the middle part of the valley stands the famous Bait Ullah (House of God), once called al Belkat, which, like the edifice at Medina, is chiefly remarkable for the monument it contains. The ka'bah is so called from its form being nearly a cube, (ka'ab). It is a massive structure of gray Meccah stone, nearly 41 feet long by 35 feet wide, and from 35 to 40 feet high, with a flat roof, supported by two columns, between which are hundreds of lamps hung in festoons. The ka'bah is encircled by an immense curtain (kessona) of rich black stuff, on which appears in large Arabic characters the essence of the mahomedan creed, "There is no other deity but God, and Mahomed is the prophet of God, also some prayers worked in gold thread. Beyond these are the mambar (pulpit), El Bab-us-salam, and the building enclosed the well of Zamzam, which, according to tradition, was that fount by Hagar when Ismael was perishing from thirst, the spring is so abundant that it supplies a large portion of the consumption of the city. Serving as an upper chamber to this structure is the Makam-us-Shatiab, and opposite to the remaining three sides of the ka'bah are the makam of the other orthodox sects, viz, the Hanefi, the Hanbali, and Maleki.—*Niebuhr's Travels*, Vol II p 34-36. *Malcolm's History of Persia*, Vol II p. 335. *Hamilton's Sinai, Hedjaz and Soudan*, p 131. *Burton's pilgrimage to Meccah*, Vol II pp 57, 58, 144, 145, 161, 259. *Burchard's Travels in Arabia*, Vol I, pp 242, 243, 194. *Arabic M S*, 7504 in the British Museum. *Euphrates and Tigris*, Col Chesney, Vol I, p 602 to 603. MECHI or Meche a race in the N E frontier of India who are supposed by Mr Campbell to be the same as the Bodo of Mr B Hodgson. They are Indo-Chinese of the Lohitic or Burmese branch of the Turanian family. Their features bear out this opinion. They are of good size, fair but of a yellow colour, good natured and tolerably industrious, but erratic and indifferent farmers, are addicted to spirits and to smoking opium. They are proof against malaria, and make small temporary clearances in the forest. They are inferior to the Tharu in industrial habits. The Dhimal tribe are smaller than the Mechi, but somewhat similar in appearance with a language that in some degree differs. The Kachari, Naga, Aboi, and some other tribes bordering on Assam are supposed to be of the same race as the Mechi. The Mechi form the chief population of the forests and N E Doar at the foot of the Sikkim and Bhutan hills.

and a few have recently settled on the extreme eastern portion of the Nepal Terai. The Mechi language is not written and is apparently of Bengal origin. They never live at elevations higher than from 800 to 1,000 feet above the sea and prefer cultivation in the clearances of the Terai. The Bhootan Mechi are a quiet, inoffensive, work race, they are precisely the same class as the men inhabiting the British Terai, like them they appear to enjoy perfect immunity from the ill effects of malaria. They are however a finer and less sickly and sallow looking set than the Mechi of the Darjeeling Terai, probably because the Bhootan terai is more healthy and drier than the British terai. They welcome travellers to their villages with unmistakable delight, and seem to take it for granted that having once heard their grievances we should immediately take them under our protection. Cotton was one of their principal crops, but poor, has scarcely any staple, but finer soil for the production of cotton does not exist in India. The Mechi seem to change their cultivation constantly, as would naturally be the case with so much virgin land at their disposal. The Bhootan Mechi do not cultivate more than is necessary to supply their own wants, and to enable them to comply with the demands of their rulers, for any surplus which they produced would merely form an additional temptation to plunder on the part of their Bootish taskmasters. They know they can never be rich nor even improve their position, and they do not therefore attempt it. With magnificent timber all round them, with rivers running direct down to the plains, with a full knowledge that a certain market for their timber is to be found where these rivers join the Teesta and Berhampooter on British Frontier, they dare not even cut a single tree for sale.—*M. Campbell*, pp 50, 140 See India

MECONIUM G *μηκονιον* of Hippocrates, the poppy

MECONOPSIS, from *μηκων*, a poppy, and *opsis*, a resemblance), a genus of plants belonging to the natural order Papaveraceæ, and formerly referred to Papaver

MECONOPSIS ACULEATA

Prickly poppy,	ENG	Kantā,	Punj
Guddikum,	HIND	Kanda,	"
Gudia,	"		

This is found at Kaghlan, in the Sutley valley between Rampur and Sungnam at an elevation of 10,000 to 12,000 feet, also in Nepal, Choor, Kedarkanta, and Peeli Punal. Flowers blue-purple, showy. The roots

are reputed to be exceedingly narcotic, but in alcoholic extract of one drachm of the root given to a small dog produced no perceptible effect.—*O'Sburghnessy*, p 181 *Gleghorn Punjab Report Royle's Illustrations of the Botany of the Himalayas*

MECONOPSIS NEPALENSIS, a Nepaul plant, is described as being extremely poisonous, especially its roots.—*Engl* 1796

MED, Ri, Honey

MED or Medi, a scythian tribe that colonised the Punjab. General Cunningham says that the Med or Mand are almost certainly the representatives of the Mandians who lived near the Mandus river, to the south of the Oxus, and as their name is found in the Punjab from the beginning of the Christian era, does not admit, Cunningham concludes that they must have accompanied their neighbours, the Jata or Jat, on their forced migrations to Arana and India. In the classical writings, the name is found, as Medi and Manduevi and in the mahomedan writers as Med and Meid. The tribe may have been transplanted to the banks of the Indus, when the Medo-Persian empire extended that far east, or they may have been pressed south easterly by intruding Scythians, or have left during the persecution of the Magi, who constituted one of the six tribes of Medes. Admitting that the Jaitila of the Mithabaita and the Pimants, represent the Jat, the Mudra also mentioned there must be regarded as representing the Med, confirming, thereby the antiquity and synchronisms of these two races on the banks of the Indus. The Med devoted themselves to a pastoral life, repeatedly invaded the territories of the Jats putting them to great distress and compelling them to cross the river, but subsequently the Jats being accustomed to the use of boats re-crossed and defeated the Med, whose country they plundered. They made up their differences and asked Daryo-dhama, king of Hastinapur to send them a king, and he sent his sister Dassal (Dahsalu) wife of Jayadratha whom he asked to send them a king, and he sent his sister Askalandba her capital, perhaps the Uch of later times. After a reign of more than 20 years, Jayadratha was killed on the fatal field of Thanesar, and his widow burned herself on his funeral pile. On the same field the Bharata dynasty was extinguished. The earliest historical notice of the Med race is by Virgil, who calls the Jhelum, Medus Hydaspes. This epithet is explained by a statement of Vibius Sequester which makes the Hydaspes flow past the city of Media. This is the same place as Ptolemy's Euthymedia, which was either on or near the same river and above Bukephala. Also in the Pentingerian

tables, which are not later than A D 250, the country on the Hydaspes is called Media. From this evidence, the Medi or Med were in the Punjab as early at least as the time of Vugil, or B C 40-30. Shortly thereafter, about B C 30-20, the Med seem to have been forced southwards into Sind, where the Jat long resented their intrusion. The Erythræan Periplus mentions that about A D 100, the rulers of Minnegara were rival Parthians who were mutually expelling each other. When the mahomedans arrived in Sind, they found the Med or Mand, firmly established there along with their former rivals the Jat. Ibn Haukal describes the Mand of his time, about A D 977, as occupying the banks of the Indus from Multan to the sea and to the desert between Makran and Fannah. Masudi who visited India A D 915-16, calls them residing in Sind. During the period of the Arab occupation of Sind, Mihomed Kasim is represented as making peace with the Med of Surashtra, sea-farers and pirates, with whom the men of Basra were then at war. In the mahomedan period, Amran the Barmekide governor of Sind directed an expedition against the Med, advancing from several directions and reduced them to great extremities. Nevertheless, in the time of Masudi, the inhabitants of Mansura were obliged continually to protect themselves against Med aggressions. They have remained in this locality ever since, for there can be no doubt but that they are now represented by the Mei of the Aravali Range to the east of the Indus, of Kathiawar to the south, and of Beluchistan to the west. The name of Mei or Mand is still found in many parts of the Punjab, as in Meior of the Bari and Rechna doabs, in Mera, Mandia and Mandanpur of the Sind-Sagar doab and in Mandali of Multan, offering strong evidence that the Med or Mei were the first Indo-Scythic conquerors of, and once the dominant race in, the Punjab. Meis or Moëis, the king of Pattala, who on the approach of Alexander, abandoned his capital and fled to the mountains, was possibly a Mei. The Mei of the Aravalli are but little advanced beyond the tract where the Med, a thousand years ago, were a numerous and thriving population. Their brethren the Mina, can be traced in their original seats to the bank of the Indus, and Mei still reside in Kathiwar, the Surashtrian peninsula, which was the nursery of the piratical expeditions, and the Mei, Mena and Med seem identical. Med still exist both to the E and W of the Indus, and those on the coast, unable to practice piracy, after the manner of their ancestors, follow

the occupation of fishermen. To the East, they are found living on the borders of Sind and Jodhpur, the seats of their occupation during the Arab period, and to the west, they are found in the little port of Makran, from Sanmani to Charbai, divided into the clans of Gazbari, Hormari, Jellazai, and Chelmaizai. When the mahomedans first appeared in Sind, towards the end of the seventh century, the Zath and Med were the chief population of the country. But the original seat of the Med or Medi, was in the Punjab Proper, from which Mr Thomas concludes that the original seat of the Jati or Jat colony was in Sind. The Med of Sind, are now a sea-faring and fishing population on the sea ports of the Mekran coast. *Elliot's Hist of India*, pp 515 to 531. See Mekran, Guzbur. Meena Mei, Kelat.

MEDALAKRI, HIND *Tetranthera monopetala*, and *T. roxburghii*

MEDEA, an ancient territory now included in modern Persia. The nations of Iran proper or the Arian stock of languages comprise those of Medea and Persia. It includes the Zend of the Cuneiform inscriptions and the Zend Avesta, the younger Pehlevi of the Sassanians and the Pazeud the mother of the present or modern Persian tongue. The Pushtu or language of the Afghans belongs to the same branch. The Iranian languages of India are represented by the Sanscrit and her daughters. The Mede were of six tribes, of whom the Magi was one. This race also were classed as Arian. The Mede had many colonies, Herodotus mentions the Sigynnæ, a colony settled beyond the Danube. Medians are also said by Sallust to have accompanied the expedition of Hercules when he crossed over from Spain into Africa. The Sauromatæ were Median colonists beyond the Tanais or Don, and the Matienoi, Matienes, Kharumatæ, and possibly the Maes, were Caucasian

colonists from Medea, preserving in their names the national appellation of Mada or Madia. Medea and Babylon, till the 8th century B C, were tributary provinces of the Assyrian empire—*Elliot*, p 525 *Bunsen*. See Babylon, Hindoo, India, Irak, Kukook, Sakya mun.

MEDHA, Sans apprehension or conception, from medh, to be apt to learn.

MEDHRA. See Bhavani, Hindoo.

MEDHURST, a British consul in China, author of the Chinese and their rebellion.

MEDI, THE *Ficus racemosa*, Linn.

MEDIA-BHUMI, most nations have indulged the desire of finding the source whence they issued, and few spots possess more interest than the elevated Media-Bhoomi, or Central region of Asia, where the Amu, Oxus, or Jihoon, and other rivers, have their rise, and in which both the Sooria and Indu races (Saca) claim the hill of Su meru as sacred to a great patriarchal ancestor, whence they migrated eastward. The hindus do not make India within the Indus the cradle of their race, but west, amidst the hills of Caucasus, whence the sons of Vairaswata, or the 'sun-born,' migrated eastward to the Indus and Ganges, and founded their first establishment in Kosulya, the capital of Ayodia, or Oude—*Tod's Rajasthan*, Vol I, p 24. See Soomeru. Medya-wai.

MEDIA HYRCANIA. See Kabul.

MEDICAGO SATIVA, Linn.

Valaiti Jawat of Bombay | Rishka, dureshta, Pusuru
Lucerne, Eng | Hol, Ladak

This genus of plants belongs to the Leguminosæ, to the tribe Lotææ, and sub-tribe Trifoliæ. Lucerne grows wild in Kashmir, in Ladak, and in the Pin Punjal range, is found wild in the N W Himalaya from 5000 to 12,000 feet, and is cultivated extensively in Afghanistan, where it is used as fodder for horses, &c. Moorcroft says 'that it is cultivated, also, in Ladak and that fields of it continue to be regularly cut for 50 or 60 years.'

This is the *Μηδική* of Theophrastus, 'Plant de Caus,' lib 2, cap 20, and the *Medica* of Pliny, lib 2, cap 20, also 18, cap 20. Lucerne is cultivated in the Deccan for feeding horses, also in Guzerat, where it is coming first into use among the natives as green food for cattle. It is propagated by seed, and may be sown at any season, in beds or rows. It requires much water, and each plant should have five or six inches of space allowed to it. Cultivators generally cut it, as it begins to blossom, when fresh shoots spring up, and by manuring it occasionally a succession of crops is continued in this way for several months.

Of the grasses eaten by cattle, Sir A. Burnes mentions that three are cultivated in Cabul, *rishka* "or *Medicago sativa*, the common lucerne, *Shattul* a kind of trefoil, and the *Si-buga* (three leaves) a clover found to be new to Europe, which from its great yield was named *Trifolium giganteum*. Another plant, the *Melilotus leucantha* or Bokhara clover, differs much from the *Trifolium giganteum* in its properties, though like it of luxuriant growth. The pig, the cow, the horse, the sheep, and the goat, the most useful creatures to man, are wanted everywhere where men live, and there are seventy-two kinds of food which the pig will eat. Two hundred and sixty-two, the horse. Two hundred and eighty-seven, the sheep. Four hundred and forty-nine, the goat—*Dis J L Stewart, M D and Riddell Eng Cyc*.

MEDICINE. The medical art, amongst the natives of the South and east of Asia, has had the knowledge of western Europe added to it, during the sixteenth and up to the nineteenth centuries, and from Europe, to the Pacific Ocean, in Egypt, in Africa, in Turkey and Persia, and in the British, French, Portuguese, Dutch and Spanish East Indies, are many medical schools and numerous European, American and native medical men teaching and practising their professions according to the doctrines of the schools of Europe. Amongst the hindus, the art of medicine has been carefully studied from the most ancient times, and books on the subject have a large circulation. Of these, the *Ayur Veda*, which is reckoned a portion of the fourth or *Atharva Veda*, is considered the oldest treatise and the highest standard. It is said to have consisted originally of one hundred sections, each containing one thousand stanzas, but fragments only are now procurable. The works of Charaka and Susruta, who are said to have lived about the time of Rama, are also regarded as of great authority and Agastya a Tamil writer is fabled to have written upwards of fifty treatises on medicine, alchemy and magic, but some of those attributed to him have been composed after the arrival of Europeans in India and there are upwards of 120 Tamil works on medicine some of them of considerable size. Amongst the hindus of the nineteenth century, medical science is, however, much in the same state as it was in Greece in the time of Hippocrates and the Greeks seem to have derived from India, their systems of philosophy and medicine. Hippocrates and Plato taught that fire, air, earth, and water were the elemental constituents of our bodies. The views which Pythagoras and Plato en-

maintained of health and disease, precisely accord with those of Plato and the hindu Susruta and the hindu system of therapeutics is much the same as that of Galen, who taught that the properties of all medicines are derived from their elementary or cardinal qualities, heat, cold, moisture and dryness, and if a disease be hot or cold a medicine with the opposite qualities is to be prescribed. A general belief in the hot and cold inherent qualities of medicines at this day pervades the whole of India, and the most illiterate labourer as well as the most learned Pandit explains the action of medicine on this Galenic principle only, some hindoo medical men are able and trust-worthy but the great mass of the native medical men have not yet been taught the science of Europe, and have not the slightest knowledge of therapeutics. Nevertheless their materia medica, is sufficiently voluminous, and their rules for diagnosis define and distinguish symptoms with great accuracy, they have also paid great attention to regimen and diet, and have a number of works on the food and general treatment suited to the complaint with a variety of works on the medical treatment of diseases, containing much absurdity with much that is of value. Their value of experience and of a thorough education is also proved by many of their proverbs, the mahomedans of Persia and India, tell us much of this, Khair-i-jam, with a half educated physician there is a danger to your life, which is the English proverb.

A little knowledge is a dangerous thing. A familiar Tamil proverb warns that he only can be a good doctor who has killed ten persons, and a Singhalese proverb is that he who has killed half a thousand is half a doctor, But both the Tamil and Singhalese proverbs simply mean that there is as yet no regular teaching for their physicians who must acquire their knowledge by their own series of successes and failures. The kachabond is a herbalist. The vidyan is a learned hindu, practising medicine, the hakim of the mahomedans is a learned man and the tabib is a physician. In southern India, the native medical practitioners are either of the Yunani or Grecian school of medicine, or of the Misri or Egyptian. The Misri is sometimes designated the Suriyani or Syrian school. Most of the mahomedan physicians are of the Yunani school, and the generality of the hindu physicians follow the Misri school. The Yunani physicians use chiefly vegetable drugs in their treatment of the sick, and with them bleeding is deemed a suitable line of practice. The Misri physicians, on the other hand, chiefly use

oxides of metals, sulphur, cinnabar or sulphide of mercury, and orpiment or sulphate of arsenic, but these drugs are first combined, by the action of fire, with some other mineral substance, otherwise they are regarded as noxious. Also, they consider bleeding as never admissible. Every mahomedan gentleman necessarily knows something of the healing art. The medical profession, therefore, ranks next to the clerical in point of respectability, and so highly is the study thought of, that even royalty itself will occasionally condescend to dose its subjects. There are now (1872) in Madras, several men of noble family who regularly give medical advice gratis.

The British Indian Government has established Medical Colleges at Calcutta, Madras, Bombay, and Lahore, and at Bireilly is a medical school for native guls. In the first century, of the christian era, Dioscorides made enquiry into the medicinal virtues of many Indian plants which were then brought to the markets of Europe. In the second century, the great Cornelius Galen published his famous work, the leading opinions in which, as to hot and cold medicines, were borrowed from India, where they still prevail. In the 7th and 8th centuries, natives of India practised as physicians in the Arabian hospitals of Bagdad, employing many valuable Indian drugs in their practice. Under Munan, the Arabian professors of this School obtained, and taught from translations of, the Sanskrit medical shastras of Charaka and Susruta. Thus in teaching medicine to the hindoos and mahomedans, Europeans are, literally, merely repaying, what, for at least seventeen centuries, they owed to India. The first establishment which English enterprise obtained in India was won by the science, and the noble disinterested patriotism of two British surgeons—Gabriel Broughton who cured Shah Jehan's daughter of a frightful burn, and William Hamilton who cured an ailment of Feeroz Shah. On the 10th January 1836, pundit Mudoosoodun Goopta, a medical teacher of the bud or physician caste, began to teach the hindus the study of practical anatomy by dissecting a human body with his own hand. And now, in 1872, about three thousand subjects are dissected annually by 1,200 Native students in the medical colleges of India. Also hindoo gentlemen, who, having passed through a course of study, as complete as any school in Europe can afford, have lately received in the Calcutta University, that high degree of Doctor, which, in Salamanca of old, gave the humblest scholar right of place among the superb Hidalgos.

MEDICINAL SUBSTANCES

of Spain, which, in England, ranks the physician and his brother Doctors Graduate, only a few degrees below nobility Doctor Chuckerbutty, a native of Bengal, and the first of his nation who achieved the honor of becoming a medical officer in Her Majesty's Indian Army, first projected the Bengal Medical Association. About the year 1840, the plan of a Medical Mission was first recommended for China,—that is, of a Christian mission, the main object of which was the conversion of the natives, the missionaries being medical men, securing an introduction through the practice of their profession. The arrangement seemed to be, for China, one of the best that could be conceived and a similar plan has been adopted in India, in which Christian missionaries practice medicine, whilst instructing in their own doctrines. The Revd Dis Scudder, Strachan, Cuslaw, Elder, Elmslie, Valentine Parker, Green, Williams, Chester, Palmer, and Paterson, have taught a pure faith to, and cured the bodily ailments of, the people and their names will long be remembered,—They will do more to christianize Asia, than non-medical missionaries, who, though highly educated, deeply learned in controversial theology, skilled in Hebrew and the Classic languages of Greece and Rome, versed in the history of the Church and its ministers, and familiar with every page of the Bible, take a closet or a student's view of people and of things—a view as remote from reality as possible. But the medical art has given a good introduction to the mission field, and the creation of a favorable impression amongst the objects of their future labours, in the exercise of secular vocation by which the heathen are exalted, civilized, and advantaged. Most of the Natives of India continue shy of calling in the aid of a European doctor, and commonly he is not sent for till the prayers and juggling tricks of the village medical man have utterly failed, and the poor patient on the point of dying of a disease which, if properly treated at the commencement, might easily have been cured. The white doctor is then requested to come, as a last resource, but he comes only, to find that he has been sent for too late to be of any use, and that the patient has been reduced to the last extremity, by a course of treatment, the most absurdly injudicious that could be devised.—*Richard F. Burton's Scinde*, p 399

MEDICINAL SUBSTANCES The medicinal substances employed by the people of Eastern and Southern Asia are very numerous and drugs to the number of ninety are found perfect substitutes for those employed

MEDICINAL SUBSTANCES

in Europe The following are the better known —

Catechu	<i>Acacia catechu</i>
Aconite	<i>Aconitum ferrox</i>
Sweet flag	<i>Acorus calamus</i>
Bael fruit	<i>Aegle marmelos</i>
Mutty pal	<i>Ailanthus malabaricus</i>
Alres	<i>Aloes indica</i>
Galanga root	<i>Alpinia galanga</i>
Chnetta	<i>Andiographis paniculata</i>
Lemon Grass, Citronelle	<i>Andiopogon citratus</i>
Roosa Grass	<i>„ calamus aromaticus,</i>
Prickly poppy	<i>Aigemone Mexicana</i>
Indian Birthwort	<i>Aristolochia indica</i>
Dhak kino	<i>Butea frondosa</i>
Indian hemp	<i>Cannabis sativa</i>
Senna leaves	<i>Cassia senna</i>
Puigug cassia	<i>Cathartocarpus fistula</i>
Chitorea	<i>Chitorea tenata</i>
	<i>Corculus indicus</i>
	<i>Colchicum</i>
Croton seed	<i>Croton tiglium</i>
Colocynth	<i>Cucumis colocynthis</i>
Thorn apple	<i>Datura stramonium</i>
Foxglove	<i>Digitalis purpurea</i>
Borneo camphor	<i>Dryobalanops camphora,</i>
Gamboge	<i>Gucinia pictoria</i>
Dikkamully gum	<i>Gaidema lucida</i>
Bonduc nut	<i>Guilandina bonduc</i>
Chaulmoogia	<i>Gynocardia odorata</i>
Country Sarsaparilla	<i>Hemidesmus indicus</i>
Hydrocotyle	<i>Hydrocotyle asiatica</i>
Henbane	<i>Hyoscyamus niger</i>
	<i>Juniper berries</i>
	<i>Kreyat</i>
Linseed	<i>Lium usitatissimum</i>
Chnetta, variety of	<i>Ophelia elegans</i>
Assafetida	<i>Nardus assafetida</i>
Opium	<i>Papaver somniferum</i>
Cubebs	<i>Piper cubeba</i>
Black pepper	<i>Piper nigrum</i>
Indian Leadwort	<i>Plumbago zeylanica</i>
True kino	<i>Pterocarpus marsupium.</i>
Pomegranate Rind	<i>Punica granatum</i>
Rhubarb	<i>Himalaya and Tibet</i>
Castor Oil	<i>Ricinus communis</i>
Different sorts of Galls	<i>Terminalia catappa, and</i>
	<i>other species</i>
Country Ipecacuanha	<i>Tylophora asthmatica</i>
Sarsaparilla	<i>Smilax</i>
Nux vomica	<i>Strychnos nux vomica</i>
Cleaving nut	<i>Strychnos potatorum</i>
Connessi bark	<i>Wrightia antidysenterica</i>

The Tenasserim Provinces are rich in medicinal plants, both in number and quality. Lindley's *Flora Medica* contains descriptions of all the known medicinal plants in the world, and more than a title of the whole number may be seen growing on the Tenasserim coast. If deprived of European drugs and left to our own resources, good substitutes could be found for almost every article in the medical flora. The bark of the root of the red cotton tree, and the roots of the clitoria are emetic, and the root of *Tylophora vomitoria* has been pronounced by Indian practitioners not inferior to *ipecacuanha* for any of the purposes to which that medicine is applied. *Cassia fistula*

podis, the chebula fruit, the root of the heart seed, the seeds of the sipodilla, the Otahete gooseberry, and physie nut are aperient or purgative. The gum of the white cotton tree, the bark of Wrightia and dysentaria, and the peel of the mingosteen are prescribed in bowel complaints. The green fruit of the papaya, the root of the Persian lilie, and the fruit of the Rangoon creeper are vermifuges. The bitter roots of *Sida acuta*, and *Tephrosia purpurea*, and the seeds of the musk-mallow or musk plant, are deemed cordial and stomachic and the bark of *Gaultheria bonduie*, is considered a good substitute for cinchona where that cannot be had. The decocted leaves of the goat-footed ipomoea are used as an external application in colic. The leaves of the *Vitex trifolia* are applied in diseases of the spleen. The bark of the white plumbago root will raise a blister, almost as quickly as cantharides. The oil of the cashew nut has been used successfully in ring-worm, ulcers and corns. The mango tree exudes a large quantity of gum-resin resembling bdellium, and an indigenous pine can furnish any quantity of turpentine. The bark of the root, the leaves, and the fruit of the Bengal quince, are as popular with the natives, as the root, bark, flower, and fruit of the pomegranate, which have been famous for their medicinal properties ever since the days of Celsus. Many medicinal substances, employed in India, are unknown in any European pharmacopœia. Calomel, a chloride of mercury, as used in medicine by European and Native medical practitioners, is also known in India as Ras-kapni but it is rarely free from soluble corrosive sublimate unfitting it for medicinal use and is often present in poisonous proportions. —*M E of 1857*. Dr. Masch's *Tenasserim*. *The Indian Field*. Dr. N. Chivers, President in *Proceedings the Bengal Medical Association*, *Bombay Times*. Dr. Murdoch's letter to Lord Napier. Dr. Impey *Powell's Hand-book*. Dr. J. L. Stuart, *Punjab plants*.

MEDICINAL ACACIA Eng. Acacia catichu — *Willd*

MEDINA, a town of Bahrein island. See Kattywai.

MEDINA, about a day's journey distant from the port of Jumbo, is a city of moderate extent, surrounded with indifferent walls, and situate in a sandy plain. Before the days of Mahomed, this city was called Fithneb, but it was re-named Medinat-un-Nabi, the City of the Prophet. The tomb of Mahomed is at Medina and is held in respect by the mahomedans, but they are not obliged to visit it in order to the performance of any devotional exercises. Mahomedans attach much

importance to, and consider sanctity derivable from, burial in particular spots, though the notion appears so entirely contrary to the spirit of their religion. Great numbers of dead are sent continually from all parts of Persia for interment, at the sepulchre of Ali on the frontier of the Arabian desert. The prevailing idea is that, by being buried near a holy saint, they will be raised along with him at the resurrection, and receive his protection and countenance, but the opinion is certainly heterodox. A similar idea seems to have been received in Israel of yore: the old prophet of Bethel desired to be buried beside the man of God that came from Judah, whom he had deceived into his destination, and Acts 7 and 15-16 is to the same effect. One traveller relates that he met a caravan of dead. Each male bore two dead bodies slung like portmanteaus on either side, and by the time they reach their destination the loathsome burdens must be in a shocking state, for already the effluvia was most obnoxious. A few of the friends and relatives of some of the deceased, were accompanying this mournful caravan but by far the greater number of the corpses had been consigned to the muleteers, without any one else to look after them. — *Niebuhr's Travels*, Vol II 39, p 40. See Khazery, Khalf, Wahabi.

MEDI-PANDU Tri. Figs

MEDITERRANEAN SEA By way of eminence, is called great sea. Number 6, and elsewhere. In Exod xxi 31 it was called the sea of the Philistines, because their country Palestine bordered on its shores. It separates Europe, Asia and Africa. — *Robinson's Travels Palestine and Syria* Vol I p 29.

MEEL Dur Merl

MEENA The Meena race constitute a large
portion of the population of Rajputania, es-
pecially in the Jeypur country between Ajmer
and Delhi. They are supposed to be related to
the Man, or Mei, or Man and out of their
own country are known as fine powerful
men, principally dacoits. Colonel Tod,
writing in the early part of the nineteenth
century says, that the Meena afford an
excellent practical illustration of Menn's
axiom, that "the right in the soil belongs to
him who first cleared and tilled the land." The
Rajpoot conqueror claims and receives
the tribute of the soil, but were he to at-
tempt to enforce more, he would be brought
to his senses by one of their various modes of
self-defence—incendiarism, self immolation,
or abandonment of the lands in a body.
Throughout India, he adds, where traces of
originality yet exist, it will invariably appear
that the right in the soil is in the cultivator,
who maintains even in exile the huk bipota
ea-bhom, the ancestral right to the land, in
as decided a manner as any freeholder in
England.

The Cheeta-meena are a branch of the Meena
race, from whom sprung the Man or Mea
race, the mountaineers of Rajpootana, one of
the aboriginal races of India, whose country
is styled Mauwaria, or "the region of the
Man." The Man is a branch of the Meena or
Mama. The Man is also called Manote and
Manawut, Mauwaria is that portion of the
Aravalli chain between Komulmer and Aj-
meer, a space of about ninety miles in length
and varying in breadth from six to twenty.
Rajpootana rises from three to four thousand
feet above the level of the sea. Meer is a
mountain' in Sanscrit, Manawut and Ma-
note 'of or belonging to the mountain,' the
name of the Albanian mountaineer, Mainote,
has the same signification. The Man are a
branch of the Cheeta, an important division
of the Meena, a race which consist of as many
branches as their conquerors the Rajpoots.
All these wild races have the vanity to
mingle their pedigree with that of their con-
querors, though in doing so they stigmatize
themselves. The Cheeta-Meena in this way

claim descent from a grandson of the last
Chohan emperor of Delhi. Unail and Anoop
were the sons of Likhia, the nephew of the
Chohan king, and the coconut was sent from
Jesulm, offering princesses of that house
in marriage, but an investigation into their
maternal ancestry disclosed that they were
the issue of a Meena concubine and then
both being thus revealed, they became exiles
from Ajmer, and associated with their ma-
ternal relatives. Unail espoused the daughter
of a Meen chieftain, by whom he had Cheeta,
whose descendants enjoy almost a monopoly
of power in Mauwaria. The sons of Cheeta,
who occupied the northern frontier near Aj-
mer, became mahomedans about fifteen
generations ago, when Doodha, the sixteenth
from the founder of the race, was created
Dawad Khan by the hakim of Ajmer, and as
Athoon was his residence, the "Khan of
Athoon" signified the chief of the Manote.
Athoon is still the chief town of the Ma-
ra. Ching, Jhik, and Rajosi, are the
principal towns adjoining Athoon. Anoop
also took a Meen wife, by whom he had Bura,
whose descendants have continued true to
their original tenets. Their chief places are
Bura, Burawaria, Mandilla, &c. The Meena
were always notorious for their lawless habits,
and importance has been attached to them
so far back as the period of Bessaldeo, the
celebrated prince of Ajmer, whom the hind
Chund states to have reduced them to sub-
mission, making them 'carry water in the
streets of Ajmer.' Like all mountaineers,
they broke out whenever the hands of power
were feeble. The Meena of Mewar were the
prior occupants of Mauwar and Jeypoor,
till driven out by the Rajpoots. The most
powerful clans of the Mauwar Meena found
shelter in a strip of country at the junction
of Boondec, Meywar, Jeypoor and Ajmer,
called the Kherai. They are a very brave,
bold, race. The Jeypoor Meena in like man-
ner have their stronghold at the junction
of Ulwar, Jeypoor and British districts. In
Serohee, the Meena are still the aborigines.

The Meena are active and energetic and
are concerned in most of the dacoities of
Northern India. When Colonel Tod wrote in
the early part of the nineteenth century he
mentioned that on the borders of Little
Sadr, where the quotas are posted, is a
mountainous tract covered with deep forest,
the abode of the half savago Meena and
Bhil. Mixed with them are the estates of
some vassal chiefs, whose duty it was to re-
press their excesses. The people who oc-
cupy the Aravalli, are the Meena moun-
taineers, a robber predatory race. The hills
are rich in mineral products, and enabled

MEENA

the Mewar family long to struggle against superior power and to raise those magnificent structures which ornament their kingdom.

In Northern Rajpootana the country to the east of Shekhawattée is the chief home of the plundering Meena, and it is a region politically as well as naturally favourable to the dacoit and the thief. Wild hills and ravines abound in parts of it. Within a radius of twenty-five miles is comprised a territory subject to no less than nine Governments, namely a part of Shekhawattée and Jounawatten in the dominions of the maharajah of Jeypore, Kol-Poottee belonging to the raja of Khetree, but held direct from the British Government, Dadree to Jheed, Nannoul to Pattiala, Kante to Nabha, a portion of Uwar, Loharoo and Bikanere and Shahjehanpore where he the Meena settlements of the district of Goorgaon. These tracts are superintended by several officers, the Commissioner of Delhi, the Commissioner of Umballa and the Rajpootana Political Agencies. The Meena are not of low caste like the Sansee, the Bhowree and other thieving tribes. A thousand years ago, Meena chiefs ruled much of the territory now held by the maharajah of Jeypore. A clan of them are still the hereditary guards of the city gates and of the fort which holds the treasures of the State. Many years ago Sir W. Sleeman pronounced the Meena "indeclamable," and when Col. Younghusband, about 1864, took the Berar Police in hand and began operations which resulted in complete success, the Meena from the north were the most formidable class with whom he had to deal. The Thuggee and Dacoity Department has been bringing the Meena to justice ever since its operations began, but special efforts and systematic proceedings against them in their homes have never been pursued so persistently and vigorously as the matter required. An officer was then appointed to conduct, under Col. Hervey's direction, operations for the suppression of dacoity throughout Northern Rajpootana, amongst the Meena, who in consequence of the late famine, had been doubly active in robbing the Government mail and committing other depredations. They make free use of the railway and have, it is said, resolved in council assembled to continue their mode of life and resist all measures of repression and reform. The Meena to the north of Jeypore are not more likely to defeat the object aimed at than were the Panhar Meena to the south of it, whose suppression has been recorded by the late Capt. Bruce, Political Agent of Harotee. The mode of proceeding in Native States, when the chiefs act at all against

MEERANZYE

robber tribes, is to drive them away if possible, and this was formerly the system in Jeypore. But as Major Beynon in his report on that State remarks, the true way of dealing with them is to control their movements at their homes, where they rarely commit depredations. The successful plan pursued against the Panhar, was to hold the headmen responsible for the presence of the Meena in their villages. None could absent themselves from their respective villages without a leave certificate, or if any did so they were liable to be seized and punished. This system of control has not been regularly introduced into any of the villages of Jeypore or the territory adjoining, but with the aid of the Political Agent and the frequent visits of the dacoity suppression officer it might be done efficiently in the adjoining pergunnah of Shahjehanpore in Goorgaon, where many of the worst disposed Meena live. *Mr. Campbell*, p. 45 *Colonel Brooke*, in *Lt. Col. Tod's Rajasthan*, Vol. I, p. 681 Vol. II p. 612, 672. See *Med*.

MEENA, a term commonly used in the Punjab, expressive of contempt or opprobrium — *Cunningham's Hist. of the Sikhs*, p. 57.

MEENABAN BURM is called Moulmein Lancewood, and is useful for handles of tools, but it is not equal to lancewood in elasticity, Major Benson thinks its qualities have been generally overrated, besides, it is liable to the attacks of insects.

MEENA-BAZAR or Mina Bazar, MAHR. An exhibition.

MEEONG TOOTOOL, MALAY of JAV. *Felis pardus*. *Linn. Temm. Syles*.

MEEP-THUA-BAN BURM. In Tavoy, a small sized, compact, grey wood used for handles, &c. — *Dr. Wallich*.

MEER. A title by which the Syeds the descendants of Mohamed, are called.

MEERA BAI, was a daughter of the Rahtor of Manta, the first of the clans of Marwar, and the wife of Jana Koombhoo of Chitor, she lived almost in the middle of the fifteenth century, and was celebrated for her beauty and her romantic piety. She was a poetess, and some of her odes and hymns to Krishna are yet admired and supposed to equal in merit those of Jayadeva, she visited all the shrines of Krishna from the Jumna to Guzerat.

MEER ALUM. See Hyderabad.

MEERAN MOHI-OD-DON. See Duttagee.

MEERANZYE. In continuation of the Kohat Palley there runs the valley of Hungoo, or Hangoo, twenty miles long by two or three broad, which opens into the plains of Meeranzye. This latter plain, about nine miles square, and bounded on the south-west by

the Khoorum river, scarcely twenty miles distant from where it emerges into the Bunnoo plain, is held by seven fortified villages. The Zymosht Affghan are a small, but brave tribe, numbering about 5,000 fighting men, some of whom are well mounted. They inhabit a valley leading from western Meeranzye onward, towards the crest of a range called the "Powai Kothul." Their country of right belongs to the Cabul kingdom. They are usually ready to combine for mischief with the Tooree and Oinkzye, and to threaten Meeranzye, they hold some land in the plains, which holding affords some pledge for their good behaviour. — *Records of the Government of India*. See Khyber.

MEERAPA-KAILLU TEL Capsicum

MEERASDAR A term in use amongst the Bombay revenue officers, signifying a hereditary occupant of land, whom Government cannot displace so long as he pays the appointed assessment on his field.

MEER JAFIR, to meet his pecuniary engagements, had recourse to the severest exactions. He resigned himself to unworthy favorites, and it became necessary to depose him in favor of his son-in-law, Meer Kasim Ali Khan, with whom a treaty was concluded on 27th September 1760, by which the British obtained possession of Burdwan, Midnapore, and Chittagong. Serious disputes arose between Meer Kasim and the British regarding the right of the servants of the E I Company to trade and to have their goods passed free of duty and which led at last to war. In 1764 Meer Jaffir agreed in addition to the sums for which he had contracted in a recent treaty, to pay five lakhs a month towards the expense of the war then being carried on against the vizir of Oudh, so long as it lasted. Meer Jaffir died in January 1765, and was succeeded by his son Nujum-ud-Dowla, with whom a new treaty was formed, by which the Company took the military defence of the country entirely into its own hands, and among other conditions the nabob bound himself to appoint, by the advice of the Governor and Council, a deputy to conduct the Government, and not to be removed without the consent of the council.

MEERSCHAUM, a mineral belonging to the series of silicates of magnesia. It is dull-white, opaque, and earthy, nearly like clay. Its hardness is 2.0, and specific gravity 2.6 to 3.4. A variety from Anatolia, analysed by Thompson, gave in 100 parts: Silica, 42.0; Water, 23.0; Alumina, 2.0; Magnesia, 30.5; Lime, 2.3.

When heated it gives out water and a fetid smell, and becomes hard and perfectly white. When first dug up it has a greasy feel, like

soap, and on this account is used by the Tartars in washing their linen. It is known in Europe from its being made use of in Turkey to make the bowls of tobacco-pipes, which are hence called meerschamm, and are imported into Germany where they are softened in tallow and wax, and then polished. — *Dana Mineralogy*.

MEERUT, a town and military cantonment in the north-west of India.

MEERZA PERS. When placed after a name signifies a prince, as Mahomed Ali Meerza, Hassan Ali Meerza, it is derived from the Persian compound word "ameerzadeh," born of a chief or prince. When prefixed to the name, as Meerza Musi, Meerza Hassan, &c., it signifies a man of learning, or of the pen, a man whose occupation is to write, and whose habits of life are civil. — *Malcolm's History of Persia*, Vol II. p. 411. *Fraser's Journey into Khorasan*, p. 63.

MEERZADA an honorary title of mahomedans.

MEESSE, a dentifrice meesee dan, a box for holding meesee.

MEET, MAN Salt

MEET-GNYOO, BURM. A fine tree of Amherst, with red coloured, useful, strong, heavy, wood. It is probably a species of *Acacia*.

MEETHA, HIND a preparation of aconite root.

MEETHA KADHOO HIND

Cucurbita Pepo | Sweet Pumpkin

This is grown like all the other species, and if hung up in a dry place is an excellent store vegetable, keeping for several months. — *Riddell*.

MEETHA-KAMARANGA BENG HIND *Averrhoa carambola*

MEETHA NIMBU, HIND, Limes *Citrus acida* properly Mitha nimbu.

MEETHA PCHAOO Vide Pulao

MEETHA TEETHA HIND A preparation of aconite root.

MEETHA TIL-KA-TEL, HIND Oil of *Sesamum orientale*. — *Hind*.

MEETHEE HIND *Trigonella scennam-græcum*, Fenugreek, a small annual, commonly cultivated in India during the cold season. The greens are used by the natives and the seed in curries. It is sown like all other common greens. — *Riddell*.

MEETREE, of Ceylon, *Bassia longifolia*, grows to an enormous size, affords a good shelter, and yields a useful pungent oil. Its flowers have an unpleasant smell, they are white, and fall so abundantly on the ground as to give an appearance of snow.

MEGACEPHALON RUBRIPES, the Maleo, deposits its eggs in the loose sand of

MEGAPODIDÆ

the sea beach, in holes just above high-water mark, the female lays one large egg, which she covers over and returns to the forest, but many birds lay in the same hole. A dozen eggs are often found together. One egg fills an ordinary tea-cup, from 4 to $4\frac{1}{2}$ inches long, and $2\frac{1}{4}$ to $2\frac{1}{2}$ wide. They are very good to eat, and much sought after. The hen-bird takes no further care of the eggs, which the young bird breaks through about the 13th day and runs at once to the forest. Each hen lays six or eight eggs in the season of two or three months.

Professor Birkmore's Travels, pp 101 to 378
Wallace's Malay Archipelago, Vol 1 p 175

MEGACHILE The leaf-cutter bee. Their nests are to be found in thousands in the cliffs of the hills of the Sone valley with mayflies, caddis-worms, spiders, and many predaceous beetles — *Hooke, Hun Juer*, Vol I p 52

MEGADERMA LYRA This bat is the *M. caenatica* of Mr Elliot and seems to be very generally diffused throughout India, being replaced in the Malay countries by *M. spasma* and further east by the newly described *M. philippinensis*, *Waterhouse*, P Z S 1843 p 69, while in Africa it is represented by the *M. fions* — *M. Blyth's Report* See *Chenoptera*

MEGADERMA SCHISTACEA Slaty blue Megaderme

MEGADERMA SPAS *Chenoptera*

MEGALAIMA INDICA, *Latham*

<i>M. Philippensis</i> var. <i>Lath</i>		<i>M. Indica</i> , <i>Lath</i>
Greater red-headed barbet		Coppersmith

The incessant call of this bird resembles the blows of a smith hammering a cauldron. There are several species of this genus, viz *M. flavifrons*, *M. rubricapilla*, and *M. Zeylanica* *Jerdon, Birds of India Tennent, Sket Nat Hist* p 242 See *Birds*

MEGALAMIDÆ, a family of birds comprising 2 gen 15 sp viz, 14 *Megalaima*, 1 *Megaloichneutes* See *Birds*

MEGAM PATTOO See *Salt*

MEGAPODIDÆ A family of Gallinaceous birds, found in Australia, and its surrounding islands, as far west as the Philippines and the N W of Borneo. They bury their eggs in sand, earth or rubbish and leave them to be hatched by the sun or by fermentation. They have large feet and long curved claws, and most of them rake together rubbish, dead leaves, sticks and stones, earth and rotten wood, until they form a mound often six feet high and twelve feet across, in the middle of

MEGASTHENES

which they bury their eggs. The eggs are as large as those of a swan, and of a brick red color, and are considered a great delicacy. The natives are able to say whether eggs lie in the mounds and they rob them eagerly. It said that a number of these birds unite to make a mound and lay their eggs in it, and 40 or 50 are found in one heap. The mounds are found in dense thickets. The species of the *Megapodidæ* in Loubok is as large as a hen, and entirely of a dark hue with brown tints. It eats fallen fruits, earth worms, snails, and centipedes, but the flesh is white and when properly cooked well flavoured — *Wallace* 154, 156 See *Gallus*

MEGAPODIUS, or *Leipoa*, is called by the natives of Borneo by the very appropriate name of *Menambun* (from *Tambun*, to pile, to heap up). One nest, or heap, was found close to the edge of the sea sand, and was formed over a fallen *Arnu* or *Casuarina* tree and covered, but not densely, with shrubs. The pile was sixty feet in circumference. These birds lay most disproportionately large and thin-shelled eggs, and the young comes forth from them well-plumed and sufficiently advanced to make their way in the world. The *Megapodius nicobariensis* has not hitherto been met with excepting in the Nicobars, but would appear to be "common on all the islands" of that group, according to the personal observation of the Rev J Barbe, p 351-2 — *Keppel's Ind Arch* Vol II, p 120

MEGAPODIUS CUMINGII occurs in Labuan

MEGASPIRA, a genus of molluscs

MEGAPTERA KUZIRA, a finner whale of the Japanese Seas. The Finners are *Megaptera Kuzia*. The *Kuzia*. It inhabits the Japanese seas.

Physalis iwasi The Japan Finner. It is very rare. In 1760 one, 25 feet long, was cast ashore at Ku.

Physalis antarcticus *Gray* Inhabits the New Zealand seas.

Physalis Braziliensis Bahia Finner was brought from Bahia.

Physalis australis The southern Finner, inhabits the seas of the Falkland islands. See *Mammalia*, *Whales*

MEGASTHENES, the envoy sent by Seleucus Nicator, one of the immediate successors of Alexander the Great, to negotiate a peace with Sandracottus, the Chandragupta of India. Megasthenes was perhaps the first European who had ever beheld the Ganges. He dwelt for several years in Palibothra, on the banks of that river, a city supposed to have occupied the site of the modern Patna, at the confluence of the Son, and afterwards

wrote an account of the country, which, though now lost, has probably been transmitted to us pretty closely in the narratives of Diodorus Siculus, Strabo and Arrian. Yet though his minute details seem, nay, in many respects are,—totally undeserving of credit, his general description of India may, curiously enough, be commended for its accuracy. Moreover it is to Onesicritus, one of the companions of Megasthenes, that we are indebted for the earliest account of Ceylon or Taprobane. From him we first hear of its trained elephants, its pearls and its gold. Megasthenes maintained friendly relations at the Court of Ptolemy, between Syria and India and effected a matrimonial alliance. His journal names as rivers Canos, the Cane, Cossoanus, Cosa or Coss, Soons, Soane, Condochates, Gauduck, Sambus, Sumbul or Chumbul, Agrianus, Gogra, Commenses, Caramnassr, &c &c.

Diamachus was the next Greek ambassador after Megasthenes—*Cal Rev* 1868 *Rennell's Memoir*, p. 30 *Bojnstjerna's British Empire in the East*. See India. Inscriptions, Seylar, Shaman.

MEGEONE, BURM. In Tavoy, a large tree used in building—*Dr Wallich*.

MEGHA, See Horace Hayman Wilson.

MEGHA-NADA, SANS from meghā a cloud, and nadā, a sound.

MEGHA-NAT'HA, SANS from megha, a cloud, and nat'ha, a lord.

MEGH DUTA, See Singhpo.

MEGILA, See Corchorus olitorius.

MEGHUSANAMA, See India.

MEGHA-VAHANA, SANS vahana, a vehicle.

MEGNA, a river of Bengal, runs near Bhawan gunj in Dacca.

MEHAL or Kanth, wild pear, in apple of the hills, *Pyrus baccata*, *Pyrus variolosa*.

MAHAL, properly Mahal, a palace, a district. The Tributary Mahals form a district in Central India. The Commissioners could give no details of the effect of the famine of A. D. 1867, in these districts. Mohur-bhunj is a very large territory covering an area of upwards of 4,000 square miles, and the greater part of this tract must be included in the area of most severe suffering, but the roughest approximate estimate of the mortality cannot be given.

MEHAN of Kulu, *Ulmus campestris*, the elm.

MEHDI, the twelfth and last Imam, Mahomed, surnamed Mehdi, i.e., director and leader, the Persians believe to be still alive, and that he will reappear with Ehas the prophet on the second coming of Jesus Christ. The Mehdaui or Ghair Mehdi are

not a race but a small mahomedan sect, though mostly Pathans, who believe that a religious man, who was born in Jonepu in the 16th century was Mehdi, or the prophet Ehas on his second coming, and they are styled Ghair or "without" Mehdi, because he has in their belief, come and gone. *Heriot, Quanoon-i-Islam*.

MEHIDPUR, battle fought on the 21st December 1817. See Mahatta Governments in India. Statistics of Battles.

MEHINTELAI, "the Mountain without fear," in Ceylon, is a precipitous rock about seven or eight miles to the north east of Anurapoorā, but connected with the ancient city in the time of the kings by one continuous street, along which were conducted the solemn processions of the budhist priests. The ascent to the summit is effected by a series of stone steps, about two thousand in number, winding past the ruins of former buildings, temples, digobas, and shrines, and on the loftiest peak, which commands a view over the forest country beneath to the very verge of the horizon, there exists one of those prodigious structures of brickwork, under which is deposited a sainted relic of Buddha—a hair which grew on a mole between his eyebrows. With such veneration have the Singhalese been accustomed to regard this sacred mountain, that every crag has some tradition, and every rock has been sculpted into sites for religious buildings, amidst the ruins of which are to be traced the fragments of broken statues, and inscriptions in the Nagari character, the most ancient in which the dialect of Pali has been written. The ruins of Anurapoorā, form one of the most conspicuous objects in the grand panorama which is beheld from Mehintelai. They cover an extent of ground equal to sixteen miles square, once surrounded by a wall sixty-four miles in circumference. The city is to be found on the map of Ptolemy, in its proper site and ancient name, Anurogrammum—*Tennent's Christianity in Ceylon*, p. 336.

MEHL GER Meal.

MEHMAN, a mahomedan sect, numerous about Hyderabad, Schwan and Knutachi. They are largely engaged in trade, and are a quiet race. They are converts to mahomedanism. See Mahman.

MEHMANDAR, from the Persian word "mehman" a guest, means a host, but is the term applied to a person appointed on the part of government to attend upon, and supply the wants of strangers, while travelling through the country. This custom is most particularly observed towards all ambassadors from foreign powers. The provision

MEIACOSHEMA

thus furnished is called soorsat, and it forms one of the most grievous parts of the saddest, or irregular taxes, for it is claimed not only by strangers, but by all great men, or messengers travelling on the part of the king, and is levied with extreme severity.

Usually on his arrival at a town or village, the mehmandar sends for the mayor, the Ket-Khuda, to whom he briefly gives his orders to furnish the articles required, and, by way of commencement, installs himself in the best house in the place, he then proceeds to the mosque or principal square—*Ferrier Journ*, pp 47 *Fraser's Journ into Khorasan*, p 88

MEIDZ, POL Copper

MEL-THEI-LEI, the valley of Manipore is called by the Maniporee people Meitheilei pak. The Burmese call it Ka-the, the Bengalees Moglai, and Assamese Mekle. The area of the whole Manipuri territory is about 7,000 square miles, and that of the central valley about 650. Much of the valley is at all seasons covered with water. It seems indeed at one time to have formed a large lake, and the piece of water in the south called the Logtak, appears to be the unfilled but rapidly filling, remnant of it. From the most credible traditions, the valley appears originally to have been occupied by several tribes, the principal of which were named Koomul, Looang, Moiang and Meithi, all of whom came from different directions. For a time, the Koomul appears to have been the most powerful, and after its declension, the Moirang tribe. Of the population, composed of different classes, the principal is the Meithe, next the Poongnai, after whom the Tengkul, the Ayokpa, the Kei, the Loe and Mussulman. The Meithe population is divided into four parts called "Punnah," which are designated in the order of their seniority "Kaphnm," "Lai phnm," "Ahnloop" and "Nihloop." The Loe population consists of people who pay tribute, and is considered so inferior that the name Mei-the is not given to it.

The marshes of the south in the vicinity of the Logtak afford a retreat to serpents of a formidable size, and the whole valley of Manipore is much infested by the serpent tribe. Some of them are exceedingly active and bold, as the Tanglei. It is fond of ascending bamboos, along the branches of which it moves with great velocity, and if enraged, throws itself from an extraordinary height upon the object of its anger. Its bite is said to be mortal. This, added to its great activity and fierceness makes the Tanglei an object of much terror—*McCulloch's Records Government of India, Foreign Department*, p 103 See Khutri

MEINAM, a river which disembogues into the Gulf of Siam. The area of the valley of the Meinam has been estimated by some authorities at about 12,000 square miles, but this extent probably embraces only that alluvial portion of the soil which is visited by the annual inundations. The Meinam has its source in the mountains of Yunnan in China, at a distance of about 800 miles from its mouth. It receives many tributaries in its course, divides itself after receiving the waters of the Phitsalok branch, and again unites above Bangkok, where, with a depth of from six to eight fathoms, it rolls its magnificent tide into the Gulf of Siam. Menam in Siamese is a generic name for river, and is one of the names of the Bangkok river; another meaning given, however, is mother of waters. The true name of the Bangkok river is 'Menam Chan Phya,' but it has become obsolete. At the present time, the river is only navigable to a distance of about thirty leagues. It disembogues itself through its three mouths at the head of the Gulf of Siam, after a course of nearly eight hundred miles.—*Bowring's Siam*, Vol I, p 1 10

MEIKONG A large river which flows through the eastern side of Laos and Cambodia. It is said to be more than 2,200 miles long, but much interrupted by shallows and sand banks at its mouth. In the Lusad it is noticed thus,

See tho' Cambodia Meikon's river goes,
Well named the Captain of the waters, while
So many a summer tributary flows

To spread its floods upon the sands, as Nile
Inundates its green banks

In the Irawadi and Mekong basins, there are remnants of tribes strongly distinguished from the predominant races and tending, with the evidence of language, to show that the ethnic history of Ultra-India is very ancient and has undergone repeated revolutions. One of the most remarkable is the Ki-Kyen. They are described as being in their appearance not Mongolian and totally different from the surrounding Shan, Burmese and Chinese races. The Moi or Ka-moi, on the opposite side of the Mekong, are said to be black savages with negro features. They occupy the broad expansion of the Anam chain towards Kamboja, and appear to extend northwards along these mountains, marching with the Lru on the westward. The Kambojans style them Kha-

MEKRAN

men. They are the Ko-men of Leyden and the Khamen of Gulzaff. On the same side of the Mekong basin, but towards the sea, between 11° and 12° N. L. a hill tribe, called Chong, preserve more of the ancient Australo-Tannian character than the surrounding tribes. In the Chong, the lan, instead of being stiff or harsh as in the Mongolian, Tibetan and prevalent Ultra-Indian and Malaya-Polynesian races, is comparatively soft, the features are much more prominent and the beard is fuller.—*Bowring's Siam*, Vol II p 28 *M. MEKRAN, a province of Beluchistan diversified by mountain and desert, stretching westward along the coast. It is the ancient Gedrosia and it extends along the Indian Ocean, from Cape Jask to the borders of Sindh which bounds it on the east. On the West and N W, it has Kerman, and on the North, Seistan and Airokage. Alexander the Great, after his conquests in N W India, returned through this province, and the suffering of his army from want of water and provisions, gives us a most disadvantageous idea of the country, which has been represented as unfertile and full of deserts. There are, in Mekran, cyclopean structures raised by some unknown prior race. They are called Ghorbasta or Ghorband and bear a resemblance to the cyclopean remains of Europe. They are built across ravines to form tanks and on the declivities of mountains to distribute the water. They have been constructed by an agricultural race who, on entering it, had foreseen that the country would not otherwise support them and the race is supposed by Dr Cook to have been Pelasgi or a people with knotted habits. Arrian says that the fishermen on the coast of Gedrosia lived in small huts, whose walls were composed of sea-shells piled upon each other, and their roofs of fish bones, the back bones serving instead of rafters.

The present population of Mekran is formed of many different tribes and independent chiefs of which the Baluch are the

most numerous a middle sized race of men, spare muscular, and active, and armed with a matchlock, sword, shield, and dagger. The common language of the country is a corrupt Persian, mixed with Sindi, and the generality of the Baluch are mahomedans of the sunni persuasion. Those of the centre countries reside mostly in towns, those of the lower countries are scattered over the plains, in hamlets of eight or ten huts, built of the branches of the palm, and covered with mats, but the Nairi race of Bupore live in tents of black hair, and remove from place to place, as their flocks or agriculture require their attention. The women of Mekran are treated in a different light from those of most other mahomedan countries, being allowed to appear indiscriminately in public.

Mekran is sometimes called Kej also called Kej Mekran. It is now inhabited by many tribes of whom the Gitchi is the most numerous, but about half the population is of a sect of mahomedans called Ziggar. The maritime and fishing population of the little ports on the coast of Mekran from Sanmani to Chabai, are denominated Med, and comprise four divisions, the Guzbui, Hoimani, Jellazai, and Chelmai-zai — *Kinner's Geographical Memoir*, p 202, 204. See India, Kattiyawar, Kelat, Keriman, Med, Volcanoes.

	Kajaputih, MALAY
	The oil

Kayu puteh-ka-tel, HIND | Kayu-puteh tulam, TAM

This tree is found in Amboyna, Ceram, Celebes, and Sumatra. The Malays give the name of Kaya-puteh both to *M. cajuputi* and *M. leucadendron* but *M. cajuputi* is also called Daun Kitsul in Malay. It is a small tree with an erect but crooked stem covered with thick, rather soft, light-coloured bark, branches scattered, with slender twigs which droop like those of the weeping willow. It is a native of the Molucca Islands, especially of Boerou, Mampe and of the S of Borneo. The leaves are collected on a warm dry day in autumn, and placed in dry sacks, in which they become heated and moist.

They are then cut in pieces, macerated in water for a night, and then distilled. Two sackfuls of the leaves yield only about 3 diachms of the oil. This is clear and limpid, of a light green colour, very volatile, diffusing a powerful odour, having a warm aromatic taste, something resembling that of camphor, followed by a sense of coolness. Sp Gr 0.914 to 0.927, soluble in alcohol. It boils at 343°. When distilled with water, a light and colourless oil first comes over, and then a green-coloured and denser oil, which, with less odour, is more acid. It is sometimes adulterated with the oils of rosemary and of camphor, it is diffusible, stimulant, antispasmodic, and is used externally in rheumatism. As a cure for cholera, oil of Peppermint is as useful. *Cajuputi* oil, appears to have been known only since the time of Rumphius, who describes two trees, viz *Arbor alba major*, and *Arbor alba minor*. In 1798, Mr Smith, of the Calcutta Botanic Garden, was sent to the Molucca Islands to obtain the true sort of *Cajuputi* plant. He obtained several, which were introduced into the above garden, and have since been distributed all over India, and it is able to stand the cold of N W India, probably owing to the thickness of its bark. Mr S sent specimens to England where they were ascertained by Dr Maton to be those of the second kind, and named *Melaleuca cajuputi* a name which Dr J E Smith afterwards changed to *M. minor*. The other species obtained by Mr Smith in 1798, also called *Cajuputi* by the Malays is the *M. leucadendron*, of which the leaves are larger, more falcate, 5-nerved, and smooth, but possess little or no fragrance, and are not known to yield any of this celebrated volatile oil. The *Melaleuca cajuputi*, is indigenous in the Karen forests of the southern provinces of Tenasserim but Dr Mason has not observed it north of the valley of the Palouk river in latitude about 13°. Roxburgh asserts that *M. leucadendron*, is a tree of the Moluccas, with small white flowers, possesses little or no fragrance in its leaves, and that it is seldom or never used for the distillation of the oil which is used in the European markets — *Royle Crawford, Morrison Com Desc* p 9. *Royle Materia Indica O'Shaughnessy Dispensary Roxb Fl Indica, Tenasserim Voyt* p 45.

Theet see	Burm	Theet see	Eng
Theet see yang	"	Lignum vitæ	of Pegu
Vainish tree	Eng	Kheu of	MUNIPUR
Burmese vainish tree	,		

This tree grows from Munipuri southward to Tavoy. It was first seen near Prome, but is found in different parts of Burmah and along the coast from Tenasserim to Tavoy, extending from the latter in 14° to 25° N lat, and Dr Wallch has identified it with the Kheu or Vainish-tree of Munipuri, bordering on the north-east frontier districts of Silhet and Tipperah. It grows, especially, at Knbbu, an extensive valley elevated about 500 feet above the plains of Bengal, and 200 miles from the nearest seashore and it attains its greatest size there, some of the trees having clear stems of 42 feet to the first branch, with a circumference near the ground of 13 feet. It forms extensive forests, and is associated with the two staple timber trees of continental India, teak and saul, *Tectona grandis* and *Shorea robusta*, especially the latter, and also with the gigantic Wood-oil tree, a species of *Dipterocarpus*. It is in full foliage during the rainy season, which lasts for five months from the middle of May until the end of October. It is rare in the Irawadi valley, but common in the forests east of the Sitang river, particularly south-east of Sitang town. It is very common above the parallel of Tounghoo and grows there to a girth of six feet and it is plentiful in the Tounghoo and Prome forests especially in the former. Dr Mason says, the celebrated Burmese black vainish tree, which is used to lacquer boxes, is cultivated in the Tenasserim Provinces, but he never saw it growing spontaneously. It is found very abundant in Amherst province, and grows in Tavoy and Meigui. Captain Dance says that its maximum girth is certainly 3 and said to be 4 or 5 cubits and maximum length certainly 20 and said to be 30 feet, and Dr Brandis tells us that, in a full grown tree on good soil, the average length of the trunk to the first branch is 30 feet and the average girth measured at 6 feet from the ground is 9 feet. Its wood is the *Lignum vitæ* of Pegu, and is of a dark red color, or a dark brown, dense structure, and of particularly fine close grain. Of extreme closeness of grain and density of structure, it has a specific gravity so great, that it serves in place of iron as anchors for native boats. A cubic foot weighs lbs 54, but it is not brought to Moulmein so heavy as Dr McClelland des-

MELANORRHÆA USITATISSIMA

cribes it. When seasoned it floats in water. It is very strong, durable, hard and tough, it is found to answer well for cogs of machinery and is used by the Burmese for tool helves and the stocks of their wooden anchors, &c, for, the anchors of Burmese boats are always of wood to which stones are lashed, the flakes being of Pyeng Khado and the stocks of Theetsee or of some other heavy wood. Its great hardness and weight prevent its being employed in house building, but, it would answer for sheaves or block-pulleys and other purposes connected with machinery, where great strength and density are required. It is therefore recommended for handles of tools, also of sheave blocks, for machinery generally, for railway sleepers, for gun stocks, for rammer heads, and for helves, in short for all purposes where a strong yet not very heavy wood is useful. It exudes a black gum which repels ants, and is used by the Burmese as a vainish. At Prome a considerable quantity of this vainish is extracted but very little at Mantaban. It is collected by inserting a pointed joint of a bamboo, which is closed at the other end, into wounds made in the trunk and principal boughs, which are removed after 24 or 48 hours and their contents, which rarely exceed a quarter of an ounce, emptied into a basket made of bamboo and rattan previously varnished over. The collecting season lasts from January to April. In its pure state it is sold at Prome at about 2s 6d for about $3\frac{1}{2}$ lbs avoirdupois. This oil is obtained from a large tree, formerly common in the hills of this district. The oil is obtained by cutting a hole in the tree, about 3 feet from the ground, the cut being about 4 to 5 inches deep into the trunk of the tree. The base is hollowed out to retain the oil. The whole of the hollow is cleared with fire, without which no oil exudes, after it is cleared the oil exudes, and is collected in the hollow at the base, and removed at intervals. The oil is thus extracted year after year, and sometimes there are two or three holes in the same tree, while the tree does not die. The oil is allowed to settle on which the clear part separates from a thick portion, which is called the 'gand'. If a growing tree is cut down and cut to pieces, the oil exudes and concretes on the stem and end of the pieces, very much resembling camphor, with an aromatic smell also. It is said that the tree yields from 3 to 5 maunds yearly, i.e. 240 to 400 lbs, and the same tree will yield oil for several years. It is a good balsamic medicine, and is very generally used as a substitute for copaiba, but it would be more valuable as a var-

MELASTOMACEÆ

nish it is a preservative to wood to which it gives, with little trouble of application, a fine surface and polish, it becomes, however, white and milky if exposed to wet. It can be had at Chittagong in large quantities at 10 Rs per maund. It is procurable in great quantities from Manipoor, where it is used for paving river-craft and for varnishing vessels designed to contain liquids. The drug is conveyed to Silhet for sale by the merchants who come down annually with horses and other objects of trade. In Burmah, almost every article of household furniture intended to contain either solid or liquid food is lacquered by means of it. The process consists in first coating the article with a layer of pounded calcined bones, after which the varnish is laid on thinly, either in its pure state or variously coloured. The most difficult part consists in the drying. It is also much employed in the process of gilding, the surface, being first besmeared with this varnish, has then the gold leaf immediately applied to it. Finally, the beautiful Pali writing of the Burmese on ivory, palm-leaves or metal, is entirely done with this varnish in its native and pure state.—*Artillery Records with report of woods by Captains Simpson and Babington, dated Moulmein 25th May 1842 Voigt, quoting Wallich, Pl As Bur p 9, 11 and 12 Dis McClelland, Mason, and Brandis, Cal Cat Ex 1862, Captain Dance, Royle Ill Hum Bot*

MELASTOMA MALABATHRICUM—Linn

Myet Pvai, BURU | Malabar melastoma,
Buio phutika, BENG | Kadali, MALEAL

This shrub grows in the Moluccas, Sumatra, Cochinchina, Malay Islands, in both peninsulas of India, in Orissa, Jellalore, Khasya mountains and Nepal. Its flowers are large and red, and it fruits the whole year. Its fruit is edible and is also employed for a purple dye to cotton cloths. It is one of the Black-Dye Plants of Asia. The blossoms of the shoe-flower plant are used by the Chinese to dye leather black, the juice of the cashew-tree gives a black to linen, and the fruit of this melastoma affords a black dye. In the Tenasserim Provinces, this species of melastoma with large gaudy purple petals, and long yellow stamens, is a common weed. Its calyx opens like a lid, and bears a fruit which in taste and flavour strongly resembles the blackberry of temperate regions. In Bengal the same plant is cultivated as a garden flower, but it does not compare with the wild plant of Tenasserim.—*Roxb, Mason, Voigt W Ill*

MELEAGRINA MARGARITIFERA, Lam The Pearl oyster furnishes the finest pearls and finest nacre when secreted in the globular form it is the pearl, when on the inner walls of the shell, the nacre. The pearl oyster is met with in the Persian Gulf, Arabian Coast, the Japanese and American seas, on the shores of California and near the islands of the South seas, Bay of Bengal, Gulf of Menaar, Ceylon, and near the mouth of the Indus. Pearls are said to be artificially produced by the Chinese introducing beneath the mantle a grain of sand around which the nacrous substance is thrown. The yield of the Ceylon pearl fisheries, was

1804 £120,000

1797 £144,000

1798 £192,000

MELEAGRINA MARGARITIFERA

The Pearl fisheries of Japan, Persia, &c are valued at £800,000 In all these countries the pearl fishery forms an important industry

The oyster banks off the island of Bahrein produced £240,000 and those off Arabia £350,000 The pearl mussel multiplies by means of what is technically called spat or spawn, which is thrown out in some years in great quantities, perhaps similar to the edible oyster of Britain which threw much spat in 1849, and not again until 1860 and not again up, at least to 1866 The "spat" floats in and on the water and attaches itself to anything with which it comes in contact, attaining it is said the size of a shilling in six months In its seventh year the pearl mussel attains its maturity as a pearl producer, pearls obtained from a seven year mussel being of double the value of those from one of six years of age In mussels under 4 years, the pearls are not of any mercantile value and after 7 years the pearls deteriorate Those from mussels of about 4 years old have a yellow tinge and the older kinds a pinky hue, but pearls of a red and even black as also with other colours are also met with the Baghdad dealers prefer the round white pearl Those of Bombay esteem pearls of a yellow hue and perfect sphericity while other nations choose the gems with a rich pink colour There seem reasons to believe that the pearl mussel spat is migratory, forming colonies at places remote from the parent bed Between the years 1732 and 1746, there was little pearl fishing at Ceylon and there were long suspensions between 1768 and 1796, between 1820 and 1828, and between 1837 and 1854 and during the last period the expenses were covered The late Dr Kelaaht is stated to have been of opinion that the molluscs are capable of leaving their shells In the Persian Gulf, the pearl banks extend three hundred miles in a straight line and the best beds are level and of white sand, overlying the coral in clear water and any mixture of mud or earthy substance with the sand is considered to be detrimental to the pearl mollusc In the Persian Gulf, there is both a spring and a summer fishery and as many as 5,000 boats will assemble from Bahrein and the islands and continue fishing from April to September The amount of money derived from the pearl fisheries of the Persian Gulf, has been estimated at £400,000 The net revenue from that of Ceylon, from 1828 to 1837 was £227,131 Each boat is manned with a crew of 23 persons, 10 of whom are divers, two divers to each stone, of which there are 5 in the boat When fishing for Government or for a speculator, those receive three fourths

MELOLONTHIDÆ

lower Hindustan—*Dr Hornigberger*, p 307
Ains Mat Med p 118

MELOE TRIANTHEMA, is another species *Meloe trianthema* frequently found in fields over-run with the *Trianthema decandra Willd*. It is now much used, as a safe and efficacious epispastic. Its peculiar qualities were discovered by *Dr Adam Burt*, Superintending Surgeon of the Bengal Establishment, in 1809, who first noticed the insect in fields around Muttia, it, however, abounds in every part of the Doab, and in the districts on the right bank of the Jumna—*Ainslie's Mat Med* p 297

MELOLONTHIDÆ, under the name of White grub, one of the insects injurious to coffee plants, are included the larvae of various *Melolonthidæ*, the Cockchafers of Ceylon, which do much harm to coffee plantations, young and old, by eating the roots of the trees. *Mr J L Gordon* of Rambodde considers the white grub to be by far the greatest enemy of the coffee trees which the planter has to contend with, as he never knew a single tree recover after their attack and he adds that they had destroyed, at Rambodde, in two years, between eight and ten thousand trees of fine old coffee. *Mr Gordon* used to dig up the soil at the foot of the trees and take out such grubs as he could find.

The larva of the moth called *Agrostis cægetum*, is the very destructive "black grub" of the Ceylon Coffee planters. This pest is about an inch long and is most abundant from August to October. The caterpillar lives in the ground but comes out at night to feed, and is very common and injurious. They attack not only coffee trees, but all sorts of vegetables and flowers and are very destructive to gardens and in the field, as they eat every thing that is artificially raised, despising grass and weeds. They generally appear only on certain fields and will not go over an estate. The insect is not confined to Ceylon, its ravages are well known in India, at the Cape of Good Hope, and Europe where it injures the grain and beet root crops. In Ceylon it only attacks young coffee trees, gnawing off the bark round the stem just above the ground. Where the trees are very small, they are bitten right off and the tops sometimes partially dragged under the ground, where the grubs may easily be discovered and dislodged. The damage which they inflict on plantations may be estimated when it is mentioned that *Mr Nietner* lost through them in one season, in certain fields, as many as twenty-five per cent of the young trees he had put down.

There are, in India many species belong-

MELOPHUS MELANICTERUS

ing to the *Melolonthideous* or *Cetonideous* genera, interesting to naturalists, and amongst which those soft-bodied insects, *Lampyris*, *Cebrio*, *Malachus*, &c are classed. See *Coffee Coleoptera*, *Grub*.

MELON, under this English generic name, several vegetables are known, of which a brief mention may be made.

Citrullus cucurbita, Linn

Water melon, ENG | Turbuza, HIND

The water melon is to be had at the same time as, and grown in a similar manner to, the *Cucumis melo*. The seed should always be preserved from the finest and richest-flavoured fruit, and is better for being three or four years old. The green melon, is the finest flavoured, although many of the others are very good. The cause of melons growing finer in the sandy beds of rivers are attributed to the temperature being more equal about the roots than it is in beds in the garden, especially during the night.—*Riddell*. See *Cucumis* also *Cucumis melo*.

Cucumis dudaim

Queen Anne's Pocket Melon, ENG

Is a native of Persia, and produces a fruit variegated with green and orange, and oblong unequal green spots, when full ripe it becomes yellow and then whitish. It has a very fragrant vinous musky smell and a whitish flaccid insipid pulp.

Cucumis melo, Linn

Musk melon,	ENG	Kharbuza,	HIND
Melon,	"	Saida,	"
Kharbu	HIND	Pahiz,	"

Native of Jamaica, Persia? and Kabul? but cultivated throughout India. The rock, green, and musk melons are all sown in the Deccan at the same time,—generally in beds or rivers where the soil is light and sandy. They are very seldom sown in gardens. The seed is put down in November, three or four seeds together, with as rich manure as can be procured. The plants must not be close together—a distance of from six to eight feet is generally allowed. They come in about March, and continue until the rains. In Bombay they are in season at the same time, and a second crop is grown during the rains. This is not the case in the Deccan.—*Hogg, Vegetable Kingdom*. *Vogt Hort Suburb-Calcutt*. *O'Shaughnessy, Beng Disp Roab Flor Ind*. *Riddell's Gardening*, *Jaffrey's Hints to Amateur Gardeners*.

MELON SEED OIL,

Pitcha Pussham yennai, TAV

MELOPHUS MELANICTERUS, the gamma finch, frequents fields and cultivated localities.

MEMAN

MELVILLE ISLAND, See Saxifraga stenophylla

MEMAN, a corruption of the Arabic word "Momin" (a true believer), was probably given to the people that go by the name now, when they were converted from hinduism to be mahomedans. The word, in its fullest signification, is applied to two distinct races of people, to the Khwajeh tribe, and to the Meman Sayyat (i.e., "green," from the Sindh sawo), or Achhia (white), who are followers of Abu Hanifah. Many Meman are settled in Sindh, especially about Hyderabad, Sehwan and Kurrachee. Cutch is probably their original country, as large numbers of them are still found there. In Sindh they are employed chiefly in agriculture and breeding camels. Their dress is that of the common Sindh, except that they frequently shave the head, especially when old, and wear the turban, sometimes, though rarely, they adopt the peculiar Sindh hat. They have produced many very learned men, and have done much to introduce the religious sciences into Sindh. The tribe merits some notice, as it has either abandoned or never adopted the practice common among their brethren in Bombay, viz., that of depriving the females of their pecuniary rights in wills and inheritances. Among the Meman, the widow and daughter are provided for according to the Koran. Their Pir, or holy men, are the family called Rashid Shahi (descended from one Mohammed Rashid Shah), or the Rohi-wara Sayyids, remarkable for nothing but excessive polygamy. Rashid the founder of the house, took unto himself thirty-two wives (instead of four), and justified the practice by the usual sophistical arguments of the Sufi order to which he belonged. The Sindh divines pronounced his tenets to be heretical, and his conduct damnable. The Meman, however, did not object to it, and still reverence his descendants. The Meman in Sindh has his own handwriting character, in Cutch, he uses the Guzerattee. Altogether the Meman are a respectable race, though, like the Jews, they have acquired a bad name by their incapacity in dealing with strangers, and "Wadhio Meman" (a great Meman), in Sindh means a miserly usurer.

In the Kurrachee district, they take their tribal names as given below, principally from their original places of abode. The Khwaja are of the shiah sect and call themselves followers of Khwaja Suliman, Farisi. Their tribal names are

Akhoond	Hudokut	Khebiana
Bandroo	Katiyar	Khwaja

Iron wood tree,	ENG	Kasa cheddi,	"
Anjuna	MAHR	Kayam puvu cheddi	"
Kuipa	"	Alaika chettu,	TEL
Surpa	"	Allichettu,	"

This occurs in the Malaya Peninsula, Tenasserim, Coromandel, Mahableshwar, Kandalla along the Western Ghats, in the woods about Cochin, common in jungles in the Carnatic Silhet. The flowers are small, blue, its leaves are used in dying yellow. The wood is brought into Madras for firewood and a large quantity of the leaves are imported daily for dyeing purposes. Cold infusion of the leaves imparts a yellow dye. Crimson dyes also said to be obtained from them. It is a highly ornamental tree with deep green shining leaves, flowers in February and March, of a purple colour, with the calyx beautifully streaked on the inside, it is called the Ironwood tree. It bears its flowers in compound corymbs, which contrast favourably with its shining green leaves. Dr Gibson writing from Canara and Sunda, says, *M tinctorium*, *Surpa*, *Mahr*. Ironwood of two species, wood very tough and strong for cart axles, &c. The beautiful flowers extensively used as a dye. Writing of the forests generally he says *Me tinctorium*, "*Kuipa*," "*Anjuna*." A tree of rather small size, common on the ghats above, not seen elsewhere. Wood is very strong and tough. Does not yield readily to wet. Is much employed, when procurable of sufficient size, for agricultural implements, cart-furnishing, &c. — *M C C M E J R*. *Dis Mason Gibson*

MEMNON, according to Hesiod and Pindar, was king of Ethiopia. Æschylus said he was son of a Cissian woman and Herodotus and others say he founded Susa and led a combined army of Susanians and Ethiopians to the assistance of Priam his father's brother and perished in one of the battles before Troy. The Egyptians claim him to be their king Amunoph III, whose statue became known as the vocal Memnon. Memnonia, was the name of several towns in Egypt and at Susa, supposed to have been built by Memnon, and there was a tribe of Memnones near Meioe.

MEMOKA *HIND* of Kangra, *Marha begoniifolia*

MEMPIHS The city of the Pharaohs. Misi, the town of old Cairo, near Cairo, was built out of the ruins of Memphis.

MEM-SAHIBA *ANGLO-HINDI* An English woman, mistress of a house.

MEN BURN A Burmese title bearing an ambiguous meaning, applied equally to the king of England, the Governor General of India, to the king of Burmah and to all the high dignitaries of his provinces.

MEN CHIN Literally, gate, is often used in Chinese to designate a religion. Thus King-Men, the Luminous Gate, is the synonyme of Luminous Religion, and in the monument of Si-ngan-fou, is used for Christianity — *Huc's Christianity*, Vol I p 52.

MENA See KALI. We are led to Greece by the Asvini, and to Latium by Mena or Menaca whose legendary springing from Indra seems at least (etymologically also) to identify her with Minerva springing from Jupiter.

MENADO The tongue of land in the north of Celebes, known administratively under the name of the Dutch residency of Menado, comprehends all the northern extent of the island, from the bay of Palos in the west, to the cape of Tahabo in the east, and comprises the great bay or arm of the sea of Gunong-tello, which stretches in a westerly direction between the two peninsulas. The Dutch residency of Menado includes under its jurisdiction, the whole federative states of Minabassa, the small kingdoms of the northern coast, the very extensive districts in the west part of the peninsula, where government exercises sway, besides the islands of Singuir and Talaut to the north as well as the lesser islands of the west coast and the large gulf of Tomini. The population is composed of Native Christians, Malays and Chinese. In 1850 there were reckoned in Minabassa a total of 178,272.

Natives - - -	78,700	Freed Slaves -	500
Christians - -	5,687	The districts of	
Malays - - -	2,575	Gorontalo -	50,000
Chinese - - -	510	Sanguir and Talaut islands -	10,000

and this without taking into account the number of the Alfouia population of the interior, which cannot be very considerable, seeing that the elevated and woody parts of Kayeli, Toradja and Tomeiku appear to be thinly peopled. The Minabassa confederation in the north of Celebes counts 286 villages, the principal districts are Tondano, Langoang, Kakes, Temehon, Sondei, Kawakkoang, Tompasse, Amurang, Belang and Kema. They are all under the direct authority of the Dutch Government, the resident and three other Eu-

European civil employes, assisted by an indeterminate number of native functionaries, administer the government. The resident is under the orders of the Governor of the Moluccas, the head quarters of which is Amboyna. Near Menado is a race called Binteke, strong, but intractable, who have hitherto resisted all efforts to improve them. There are some of the less civilized tribes which have semi-Papuan features and hair, while in some villages, the true Celebes or Bugi physiognomy prevails. The plateau of Tondano is chiefly inhabited by people nearly as white as the Chinese, and with very pleasing semi-European features. The people of Siau and Sanguni much resemble these, and Mr Wallace believes them probably to be immigrants from some of the islands of North Polynesia. The Papuan type will represent the remnant of the aborigines. The languages contain a Celebes Malay element, and a Papuan element, along with some radical peculiarities derived from the Siau and Sanguni islands further north, and therefore probably derived from the Philippine Islands. Celebes, on its eastern coast, is fringed by islands, and many islands are scattered over the bays of Tolo and Tomime, or Goonong Tella. Celebes, on its north coast, is in general high, bold land. Its extreme point is called Cape Coffin, and the whole of the islands that stretch from it to Menado Bay are sometimes called Banca islands.

Sanguni, and the numerous islands of this group occupy a superficies of 13 square leagues, the Talaut and the Meangis islands united are 18 square leagues, these archipelagos, formerly subject to the authority of the sultans of Ternate, now make part of the Residency of Menado. Several extinct volcanoes, and some still in full action, are found in the Sanguni group, the devastations which they commit from time to time have often been fatal to the inhabitants. The eruption of Duwana, in 1808, completely annihilated the village of Tagalando, destroyed all the surrounding forests, and suddenly deprived the inhabitants of all means of livelihood, by the destruction of their fields. The Gunong-api causes numerous ravages in the island of Siau, its peak, 6,000 feet above the level of the sea, forms the culminating point of this group. Gunong-api covers with its base all the northern part of Sanguni-besai. This volcano has not been active since 1812, when the torrents of lava destroyed the extensive forests of cocoanut trees with which this part of the island was covered, and caused the death of many of the inhabitants. These islands furnish more than twenty-five kinds of wood

suited for building and furniture. Two harbours, sheltered from all winds, exist in the larger Sanguni, one in the Bay of Taruna, the other, called Midelu, on the eastern side — *Journal Ind Arch for Dec 1850, page 764 Horsburgh Wallace Archipelago*

MENAM or SIAM RIVER, the entrance of this is in lat $13^{\circ} 30' N$, long $101^{\circ} 15' E$, it falls into the sea by several branches. Menam Bar-Anchorage in four fathoms lat $13^{\circ} 24' 50'' N$, long $100^{\circ} 36' 30'' E$, The entrance to the Menam river in four fathoms is placed on Admiralty Chart fifty two miles too far east. The town of Bangkok is 27 miles from its mouth, on an islet, in lat $13^{\circ} 58' N$ long $100^{\circ} 34' E$ *Bowring's Siam Vol I p 30* See India, Karen, Yuthia or Juthia.

MENANDER, one of the Greek kings, an Indian conqueror. Of all the kings who followed Eukratides, Menander and Apollodotus alone are mentioned by classical authorities. See Bactria. Kabul.

MENANDER a Phœnician, was in Tyre, soon after the Macedonian conquest.

MENANGKABAU A state in Sumatra the original country of the Malay race. Menangkabate States lie between Malacca and Salangor, on the one side, and Palhang on the other — *Journal Ind Archipel* See India, Jakun, Sumatra.

MENCHO — ? See *Gracula religiosa*.

MENCIUS In order to get a distinct general conception of the Chinese philosophical literature, two epochs must be specially kept in mind. The first began with Confucius (Kung-fu-tsze), who was born B C 551 and ended with Mencius (Mang-Tsze), who died about B C 317. The second began with Chow-leen-ke or Chow-tsze who commenced his labours about A D 1034, and ended with Choo-ke or Choo-tsze, who died in A D 1200. The first epoch lasted for seven generations. It was separated by an interval of thirteen hundred years from the second, which lasted for five generations. Both were periods of revival of ancient learning and of further development. Both embraced several celebrated philosophers, besides those mentioned, but in each case it was the originator and closer of the epoch who became most celebrated. The writers of the second epoch are often mentioned as the philosophers of the Lung dynasty, which latter was established in A D 960, about 70 years before Chow-tsze's labours began, and continued in possession of the sovereignty till A D 1271, till about 70 years after Chow-tsze's labours closed. Confucius, though his name in the West became identified with Chinese learning, was by no means its originator.

MENDA

Authentic though not full records embodying ethical and political doctrines, extended back to B C 2357, or to about eighteen hundred years before Confucius, while the Chinese philosophy originated with Fuh he, who lived according to tradition, some twenty-three generations before the exact chronological era, which latter took place B C 2637 with the institution of the national cycle of sixty years. Allowing thirty years to a generation, this would place Fuh-he about B C 3327. It was he who substituted writing for the knotted strings that had previously formed the only means of record, and it was he who first established marriages, and separate families. To him are also ascribed some civilization labours of lesser, but still great importance, the division of the day into twelve shun, or watches, of two hours each. Fuh-he is therefore the founder of Chinese civilization generally. But he is perhaps best known as the originator of the natural philosophy, and in particular as the author of the "Eight Diagrams," which were drawn by him as follows. —

The multiplication of these eight diagrams by themselves produced sixty four doubled diagrams such as —

MENDHI, HIND a mahomedan bride's paraphernalia

MENDICANTS are very numerous in India. Amongst other hindu mendicants are the Vaishnava, Buagee, Saiva, Sanyasi, Ramanava or worshippers of Rama, Nanuck Punthee followers of Nanuck, Kuveer Punthee, Sukhee Bhuvu, Khelanta Yogee, Kanu-pala Yogee, Shuevuree, Ughoru Pant'hee, Biamhacharee, &c &c. They have then various forms of austerities. Of hindoos who embrace a life of mendicacy, Mr Ward was informed, that scarcely less than an eighth part of the whole population abandon their proper employments, and live as religious mendicants by begging. Supposing that there are sixteen millions of hindoos in Bengal and Behar, and that each mendicant requires only one rupee monthly for his support, not less than 2,000,000 rupees, or 250,000 pounds sterling are thus paid annually to persons, the great majority of whom are well able to support themselves by manual labour. Many of the more enlightened hindoos, and brahmins, hold these mendicants in the utmost contempt, and would consider their being compelled to work as a great blessing conferred upon the country.

The Abdhut, is a hindu mendicant, of the Vaishnava or saiva sect. The term is from the Sanscrit avadhuta and this class are supposed to have shaken off the trammels of humanity.

The Akas-mukhi, from akas, the sky and mukha the face, are religious, ascetic mendicants, among the hindoos, who hold up their faces to the sky, till the muscles of the back of the neck become contracted and retain position.

The Atit, religious mendicant, is usually a vaishnava.

Gosain mendicants worship Siva in the form of the lingam, Sanyasi worship Vishnu, Sanyasi mendicants the ancient ascetics Viragi are followers of Ramanuj.

Mendicants carry water from the Ganges to a great distance. The four orders of hindu life are not now given effect to. The Bhikshuna the mendicant, of the fourth order, may now have a wife and family, *Wilson's Glossary*

MENU The Menu of the hindus are seven, Swayambhuva (who by some is termed an incarnation of Brahma,) Swaroehesa, Utoma, Tamasa, Ravata, Charusha, and Satyavata Sir William Jones has considered Swayambhuva to have been Adam, and Satyavata, Noah The Institutes of Menu were composed at least 800 but probably 1280 years before Christ Menu's Institutes are later than the Vedas, and show the legal, social and political rather than the poetical and religious aspects of brahmanism Many of his dicta by no means tend to elevate the condition of women In his lengthened catalogue of things pure and impure he, however, says, the mouth of a woman is constantly pure, and he ranks it with the running waters, and the sun-beam, he suggests that their names should be agreeable, soft, clear, captivating the fancy, auspicious, ending in long vowels, resembling words of benediction Where females are honoured, he says, there the deities are pleased, but where dishonoured, there all religious rites become useless and he declares, that in whatever house a woman not duly honoured pronounces an imprecation, that house, with all that belongs to it, shall utterly perish Strike not, even with a blossom, a wife guilty of a hundred faults, says another sage a sentiment so delicate, that Reginald de Boin, the prince of troubadours, never uttered any more refined Menu lays down some plain and wholesome rules for the domestic conduct of the wife; above all, he recommends her to preserve a cheerful temper, and frugality in domestic expenses Some of his texts savour, however, more of the anchorite than of a person conversant with mankind, and when he commands the husband to be revered as a god by the virtuous wife, even though enamoured of another woman, it may be justly doubted if ever he found obedience thereto, or the scarcely less difficult ordinance, for a whole year let a husband bear with his wife who treats him with aversion, after which probation he is permitted to separate *Tod's Rajastham, Vol I p 611 Cole*

 9,000 feet high

MERAROO, BENG Wild milkwort *Po-*
lygala ciliata minor

MERASI, ARAB A revenue term intro-
 duced into India by the mahomedans, it
 means "that which is inherited," and seems
 to have been substituted for the Tamil term
Kaniachi, or right of ownership by inheri-
 tance The term *merasidar* corresponds to
 that of the Tamil *Kani-achi-karian*, and
 means a person exercising *merasi* rights
 Supposing that the rights and claims of the
merasidar on one side, and the asserted hard-
 ship, &c of the *Poyacari* on the other are re-
 cognized, then the subject for inquiry will be
 what system of revenue administration will

best insure an augmentation of public reve-
 nue, by affording greater facilities for the
Poyacari, to cultivate, without interfering
 with the existing privileges of the *merasi-*
dai The *merasidar* will never be induced
 to forego their rights without a considerable
 compensation being paid to them The suc-
 cess of the *merasi* system in a very great
 measure depends upon the saleable value
 which grows on the land, and so long as the
 latter exists, the former cannot be annihilat-
 ed *Poyacari* who have become *merasidars*
 by purchase or other engagement, will not
 concede their rights Every individual will
 seek to rise in society, and every *Poyacari*
 wish to become a *merasidar* when a favoura-
 ble opportunity occurs Permanent *puttas*,
 one for each share of the *merasidars* should
 be issued, by which, whether the lands are
 cultivated or not, the fixed assessment will
 in any case be collected under pain of imme-
 diate sale These *putta* are to cover the ex-
 tent of land according to the different shares
 of the *merasidars*, inclusive of both the culti-
 vated and waste So that the whole *ayacut*
 or acreage of a village, exclusive only of the
bona fide *Porumboke* or sites for tanks, pas-
 ture, &c will be brought under realizable
 assessment This assessment should be sub-
 ject to no fluctuation, but may change hands
 by purchase, gift, or other transfer It ought,
 however, not to be so heavy that Government
 should constantly come under the necessity of
 consigning the land to public auction or pur-
 chasing it themselves Under these condi-
 tions each *merasidar* will be willing to keep
 only so much of the land as he is really able
 to manage, and dispose of the rest at the
 current prices The *Poyacari* will have
 thereby an ample opportunity to avail them-
 selves of becoming proprietors Labor will
 become dear and prove advantageous ulti-
 mately to the *Poyacari* Such permanent
 tenure would induce many an individual to
 acquire lands, and thereby enhance the value
 thereon The *merasidars* would part with
 the excess under such circumstances, rather
 than pay for it for years without an adequate
 remuneration

The present assessment generally on the
 cultivated lands of the South of India, is by
 no means exorbitant But it would prove
 oppressive if the assessment on "waste" be
 made leviable in full

Any scheme introduced should avoid on
 one side the evils of the *ryotwarry* system
 which tends to reduce the holdings to an
 inconsiderable and undesirable size, and
 obviate on the other the necessity of often
 falling in arrears as has been the case with
 permanently settled *Mootas* A "Khandam-

war Ryotwari" settlement will bear a strong resemblance to the estates of Malabar, the result of the most successful of revenue systems and will have the advantages of having at hand a body of independent affluent landholders in the Presidency District, from which at any time may be had gentlemen to aid our Legislative Councils with their advice and fortune when needed

MERCANDEYA, PURAN. See Lakshmi

MERCARA, the capital of Coorg, captured by the Madras Army on the 6th April 1834. The town is beautifully situated in almost the very centre of the country, and is 4,500 feet above the sea level. A regiment of native infantry is always quartered in Mercara, in a fort which was formerly the rajah's palace, and which is a very spacious and substantial building. It is supposed to have been built for the rajah by an Italian, who is said to have been bucked up in a wall as soon as the building was finished. Verajenderpet a town of Coorg, is situated on the road leading to Cannanore from Mercara, and is 20 miles from the latter place. There is a cross road from Mysore which joins the road to Cannanore a few miles below Verajenderpet, and along this road passes all the direct traffic between Mysore and the coast.

Fraserpet, another Coorg town, is situated on the road to Mysore from Mercara, and it is also 20 miles from the latter place. The river Cauvery runs past Fraserpet, and forms the boundary between Coorg and Mysore. The S W monsoons, which always rages throughout Coorg from June to November, is scarcely felt at Fraserpet, and on this account the European and Native officials reside there during the wet season, returning to Mercara as soon as the monsoon ceases. Situated at from 3,000 to 4,000 feet above the sea, but in close proximity to that element, and always swept, owing to its position at the crest of the Ghauts, by a fresh and invigorating breeze, there is not a pleasanter district in India than Coorg. The Coorg insurrection necessitated the construction of a first class road between Bangalore and Mangalore, and Mercara happened to be the spot chosen for the head of the pass over the Ghauts. It was for a lengthened period the Head Quarters of the Corps of Sappers, as its mild and temperate climate peculiarly adapted it for the training of that body in field fortification, it has since been garrisoned by a regiment of Native Infantry. Coorg became one vast coffee plantation, and estates were vigorously cleared wherever they abutted on the road, by which produce could alone be carried off and coffee became very extensively cultivated in Coorg. There

are five districts — viz at and near Verajenderpet on the Cannanore Ghat. The dry district, including Ahtoor, Setapoor, and Santa Coopa. At and near Mercara. An outlying district about eight miles from Mercara, and near the Canara boundary. There is no town or village in this district. And the Ghat leading to Mangalore from Mercara.

There are, besides, two other districts containing immense tracts of forest land. They are Nacknaad and the Beammagheriy range. The former is situated between the Mangalore and Cannanore Ghats, overlooking Malabar, and the latter range forms the boundary between Coorg and Wynaad.

MERCHANT. A great part of the town residents of British India follow mercantile pursuits. Many mahomedans, of Arab and hindu descent, as the Mopla, the Labbi, the Borah, the Melman, are active merchants. The Parsis are extensively engaged in commerce. The Baboo of Calcutta, chiefly of Sudia origin, are also great merchants. The Chettyar of Madras, all of them Vaisya hindoos, are also largely engaged and there are eighty tribes of Rajputs engaged in commercial transactions.

Mercury or quicksilver was known to the ancients. The Romans seem to have employed it as a medicine externally as did the Arabs, but the hindus were probably the first to prescribe it internally. It is found in China, at Almaden in Spain, at Idria in Carniola, and likewise in South America. It occurs occasionally in metallic globules, usually as the native bisulphuret or cinabar, combined with silver, forming a native amalgam, or with chlorine, as in Horn Mercury. It is chiefly obtained from the sulphuret by distillation with lime or with iron, which combining with the sulphur, the metal distils over and is condensed. Quicksilver, or native mercury, is said to be brought to Ava from China. The following substances are compounds of mercury, viz —

Bichloride of Mercury.

Hydragyri bichloridum	Corrosive sublimate
LAT	Oxymuriate of mercury

MERDIN ROCKS

MERESINGHA

Doppelt chlor queck-
silber, GER
Rus capoor, GUZ HIND
TAM

Bi-chlorure de mercure, FR
Sublime corrosif, "
Deuto chlorure de mer-
cure, FR

This is white, with an acrid metallic and persistent taste, without smell. It is met with in small crystals, or in semi-transparent masses. Corrosive sublimate is made in many parts of British India, and seems to have been long known to, and prepared by the natives of India.

Chloride of Mercury

Hydragyri chloridum, Proto chlorure de
Chloride of Mercury, ENG mercure, FR
Calomel, ENG LAT Mercure doux, "
Proto chloride of mercury Einfach chlor queck-
Submuriate of mercury, silber, GER

Several preparations of mercury have been described by the Sanskrit and Tamil writers, especially in the 'Purana Sastiam,' a work on Materia Medica and religious observances. Dr. O'Shaughnessy examined the processes and found that they generally led to the production of a mixture of calomel and corrosive sublimate and the analysis of all the bazaar preparations he collected, shewed their composition to be a mixture of varying proportions of these substances. The taskapur is generally considered to be corrosive sublimate, but on analysis he found that it is usually calomel. Once, however, he met a specimen which was corrosive sublimate of the finest kind. The cause of the uncertainty is to be traced in the different portions of the ingredients recommended by different native writers, and which of course must lead to the results described.

Russapuspum is a sort of muriate of mercury, in great repute amongst the Tamil people, and which appears to be administered by them in larger doses than any other preparations of this metal. But it generally happens that through defective manipulation a mixture of calomel and the bichloride is formed.

Shavnum is a strange compound administered by the Tamils in very small quantities, and it ought to be so, as it is evidently a harsh, uncertain, and dangerous preparation. In the mode of preparing it, the vapours of calomel simultaneously rising and meeting the chlorine are converted into the bi-chloride of mercury. Drs. Mason—Royle Beng Phar p 342 Revd E P Smith

shalik of Baghdad extends from the Merdin Rocks to the mouth of the Shat-ul-Arab

MERDUI, a Brahui tribe of shepherds living near Khozdar, who obtain antimony and lead from the hills of Kapper. The lead is found native, in pieces the size of marbles, a fact extremely rare in mineralogy. In writing of Jhalawan, Dr. Cook, an officer of the Bombay Army, says the mountain range of Beluchistan is the great natural boundary of Western India, and may be described, figuratively, as composed of a vast under structure, surmounted by parallel rows of walls (represented by mountain ranges) cut through here and there by long and meandering passages. Amongst these mountains, the Merdui tribe of the Brahui obtain lead ore from many spots in their vicinity and reduce it. A place called Seman situated amongst low sandstone hills, black externally, with fragments and boulders of dark blue limestone, and arenaceous numulitic rock scattered around. Beneath the sandstone is a red, sandy clay, and in this is found red ore, carbonate of lead, in thin, flat, tabular masses looking like a broken up vein, which are covered externally with a layer of calcareous earth that prevent them from being easily detected. The place where this is found can hardly be called "mines" as the shepherds merely poke about with a stick, pick up any promising pieces, roughly estimate the specific gravity by the hand, and, if they have not the proper weight, reject them. At Khozdar the implements for reducing the lead-ore are very rude. A rough furnace with four upright square stones and a hole below to insert the nozzle of a pair of bellows —

MERIAH, The name given to the human sacrifices in Orissa, where young persons are sacrificed to propitiate the divinity supposed to preside over the soil The Meriah sacrifices to the earth goddess were made without hindrance amongst the Kond hill tribe of Orissa, until the close of the Coomsoor war in 1836 At this date, Colonel John Campbell, C B, was employed to suppress them In Boad and Gumsui, the form under which the goddess was worshipped, is as a bird, but in Chinna Kennedy that of an elephant The Meriah were of both sexes captured in the plains and sold to the Kond by a race called Puna In one place, there was a pit dug, over which a hog is killed and the Meriah's face then forced into the bloody mire until dead from suffocation Pieces of the flesh were then cut off and buried beneath the village idol and in the fields of the villagers In Boad, great value was attached to the saliva of the Meriah A Meriah Agency was instituted for the purpose of suppressing the practice of human sacrifice in the Kond country and it has done as much as, if not more than, could have been expected in carrying out that object The victims of Meriah are not the Kond but natives of the low countries, bordering on the Kond mountains They were procured for the purpose, by the Kond, by a regular system of crimping and kidnapping The Kond had also been in the habit, until they were checked by the Agency, of carrying off human beings from the plains to the hills, for the purpose of sacrifice It may be easily supposed that with this object in view, they were not particular as to the caste of their victims All were acceptable, from the brahmin or mahomedan, to the pariah—without distinction of age or sex The greater number were very young children, who were purchased or stolen, carried to the hills and allowed to live till some occasion called for a sacrifice The rescued Meriah were placed in villages of their own, on land granted them by Government and they made considerable progress in acquiring settled and industrious habits The Kond inhabit an immense tract of mountainous country covered with dense jungle—they are a hardy and independent race—who look on human sacrifice as the only means of adverting the anger of heaven Meriah sacrifices in the hill tracts of Orissa have much decreased,

The Konds have given up the practice, sacrificing buffaloes instead, but the residents of Paula Kmedy still carry on that of sacrificing children to Kahi in secret. The large establishment hitherto maintained for the especial purpose has not succeeded in entirely preventing Meriah sacrifices even on shore, and on board the country ships plying in the neighbourhood of the districts where the practice prevails, they were rather the rule than the exception.

MEROE, in Lat 16° 24'. In Ethiopia, a country mentioned in the Scriptures, corresponding to the present kingdoms of Nubia and Abyssinia. It was also called Seba as also Meioe. It is named in Milton's *Paradise Lost*, when describing the inhabitants of the world,

* * * some from farthest south
Syene, and where the shadow both way falls,
Meroe, Nilotic isle, —

It was at one time occupied by Arabs under a settled form of government who conquered Nubia and harassed the Thebans. During the earlier centuries all these Arabs were easily conquered by the Egyptians. *Sharpe's History of Egypt*, Vol 2 pp 104-105 See Egypt Khadim

MERCE, A genus of molluscs

MEROOT, also called Idaan, a race in Borneo, who inhabit the more hilly districts towards the north, in the vicinity of Kina-Balou. They resemble the Kadyan, and some of their tribes who are near the capital are compelled to plant pepper and collect the produce. They appear anxious for an intercourse with Europeans, they are said to sacrifice human victims, like the Kyan. The Idaan, of different places, go under different denominations and have different languages

but in their manners and customs they seem to be nearly alike. The name "Idaan" is, in some measure, peculiar to those of the north part of Borneo, the inland people of Passu are called Darat, those of Benjai, Biagoos, the Subano of Magindanao appear to be the same people, perhaps, where the aborigines, in the several islands of the Oriental Polynesia are not negroes, they are little different from the Idaan of Borneo. The Idaan are reckoned fairer than the inhabitants of the coast, this has given rise to an opinion, seemingly wholly unfounded, that they are the descendants of the Chinese, the custom obtains of arranging human skulls about the houses of the Idaan, as a mark of affluence — *Journal of the Indian Archipelago*, No 14 Sept 1849, p 557 See Kyan

MEROPS ORNATUS, the Australian Bee-eater. It sits on twigs in open places and darts at every insect it sees.

MERSINGI, MAR Spathodea arcuata

MERTA, See Mui Bai

MERU A mythological mountain of the hindoo religionists, the Mien-mo of the Burmese, and the Simeru of the Siamese. It is termed by the hindus, in their theogony, the navel of the world, and is their Olympus, the fabled residence of their deities. Siamese and Burmese describe this mountain differently. Mr Wilford, in the eighth volume of the Asiatic Researches gives, as a specimen of the geographical style of the hindus, a translation, in the very words of the Biahmanda Purana, descriptive of this mountain. Around it are four great islands, or countries in the middle, like the gem, is Meru, a great mountain of various colours all round, like to a lotus. Every wish represents this lord of mountains as it appears to him from his station. Brahma, Indra, and all the gods, declare that this largest of all mountains is a form consisting of jewels of numberless colours, the abode of various tribes, like gold, like the dawning morn, resplendent, with a thousand petals, like a thousand water-pots, with a thousand leaves. A map of the world is given fancifully shaped like a lotus, the calyx forming Meru, like a bell, mouth upwards, or like an

inverted linga Here, on one of its three peaks, is Kailasa, the Olympus of Siva, and on another, the Sweiga, or paradise of Indra, but his terrestrial abode is otherwise described as placed in the mountains of Sitanta, skirted by a most delightful country, well watered, enlivened with the harmonious noise of the black bee, and frogs There, among immense caves, is Oudavana, or place of dalliance of Mahendra, where knowledge, and the completion of our wishes, is fully accomplished There is the great forest of the Parijata tree, of the king of the gods, known through the three worlds, and the whole world sings his praise from the Veda Such is the place of dalliance of him with a thousand eyes, or India In this charming grove of Sakra or Indra, the gods, the Danava, the Snakes, Yaksba, Rakshasa, Guhya of Kuvera, Gand'harva, live happy, as well as numerous tribes of Apsarasa, fond of sport Meru is the station of Brahma, the sun is that of Vishnu, and Jupiter that of Siva Gandha-madana, in hindu cosmogony, is one of the four boundary mountains enclosing the central region of the world, called Havritta, in which the golden mountain of the gods, or Meru, is situated The Purana are rather at variance as to its position According to the Vayu it lies on the west, connecting Nila and Nishada, the north and south ranges The Vishnu Purana places it on the south, the western mountain being there called Vipala It has, however, a Gandha-madana to the west amongst the projecting branches or filaments of Meru The Bhagavat places it on the east of Meru The Mahabharat agrees with the Vayu Purana The Padma Purana is at variance with itself, and places it in one passage on the west, and in another describes it as on the east According to this Purana, Kuvera resides on it with the Apsarasa, Gandharba, and Rakshasa The Sita, alighting on its top, thence descends to the Bhadravarsha, and flows to the eastern sea Meru mountain is famed in the traditions of the ancient Indians Pamer is the country about Meru (upa-meru) Meru seems to mean strictly the terrestrial orb, or yolk of the mundane egg In the grand epic, the Ramayana (Book 1 p 236), Mera is the mountain-nymph, the daughter of Meru and spouse of Himavut, from whom sprung two daughters, the river goddess Gunga and the mountain nymph Parbatta She is, in the Mahabharat, also termed Syeela, the daughter of Syeel, another designation of the snowy chain and hence mountain streams are called in Sanscrit silettee Syeela bears the same attri-

butes with the Phrygian Cybele, who was also the daughter of a mountain of the same name the one is carried, the other drawn, by lions Thus the Greeks also metamorphosed Paibut Pamer, or 'the mountain Pamer,' into Paupamisau, applied to the Hindu Koli west of Bamian, but the Parbut put Pamer, or 'Pamer chief of hills,' is mentioned by the bard Chund as being far east of that tract, and under it resided Kamia, one of the great feudatories of Prithivi-raja of Delhi—*Cole Myth Hind* p 253 *Moor*, p 270 *Hindu Theatre*, Vol I p 241 *Bunsen*, I p 431 *Tod's Rajasthan*, Vol I p 24 *Ramayana lib 1*, p 236. MESJID ALI, See *Mesopotamia*

MESONA WALLICHIANA A labiate plant that grows on the ascent of the Jyntea Hills, whose bruised leaves smell as strongly of patchouli, as do those of the plant producing that perfume, to which it is closely allied. *Pogostemon patchouli* has been said to occur in the Khasia Hills of India, but Dr Hooker never met with it, and he doubts the accuracy of the statement. It is a native of the Malay peninsula, whence the leaves are imported into Bengal, and so to Europe — *Hooker's Himal Joun* Vol II p 314

MESOPOTAMIA Strabo says that the Tigris washes the eastern side of Mesopotamia, and the river Euphrates its southern and western, whilst the Taurus separates it from Armenia on the north. Pliny, who is still more distinct, says that Mesopotamia has

MESOPOTAMIA

the Tigris to the east, the Euphrates west, the Persian Gulf south, and the Taurus north, with a length of 800 miles and a breadth of 360 miles, the city of Charax being at the extremity of the Gulf. *Lab vi, c xxvii* Mesopotamia extends above 10° in longitude from Bâhs, in 38° 7' 10" east longitude, to the estuary of the old Kârun, in 48° 45' 16" and 7° 31' 5" in latitude from the shores of the Persian Gulf, in 30° to Sumer-at, in 37° 31' 5" north latitude, its greatest width being about 170 miles from Jaber Castle to Hissn Keifa, on the Tigris, and its extreme length nearly 735 miles. The irregular triangle thus formed has a superficies of nearly 76,117 square miles, including the shores of the Gulf from the Paliacopas to the old Karun. Truffles and wild capers, peas, spinach, and the carob, *Ceratonia siliqua*, are found in Mesopotamia. A pea called Arab addis is particularly good. The principal towns of Mesopotamia are Diyâr Bekr, Hissn Keifa, Jezireh, Mûsul, Tekiit, Sâmmarâ and Kût-el-Amârah along the Tigris, Erzingân, Kemâkh, Egîn, Kebân Mader, Malatiah, Râm, Kal'ah, Bîr, Rakkah, Deir, Rawd, Anah, Hadîsah, El' Uzz, Jibbah, Diwânyah, Lamlûn, Sheikh el Shuyûkh, and Kûinah along the Euphrates: in addition to Suverek, O'fâh, Hâran, Seirong, Ras-el-ain, Mâidin, Nisibis, Sinjai, El Hadhi, Keibelâh, Ma-jid Alî, Samawâh, Zoberd, and many other villages, both in the mountains and along the streams, between the two great rivers. Crane, or Quade, Mohammarah, and Bâsrah are the ports; and the last, being the principal, is next in importance to Baghdâd, the capital, the inhabitants consist of Arabs, Osmanli Turks, Kurd, Turkoman, Syrians, Jews, and Christians. Arabic is the general language; Turkish, Kurdish, Chaldee, Syriac, and Syro-Chaldean dialects being the exceptions. The sunni muhammedan religion is prevalent, but in Upper Mesopotamia there are many Christians of the creed of Nestorius, (some of whom have become Roman Catholics,) and Jacobite as well as Roman Catholic Syrians.

The races that have ruled here have been many and from the most remote times and remnants are still to be traced of former dominant peoples in the varied languages still spoken. Professor Rawlinson believes that Chaldaea was a part of the great Mesopotamia plain, bordering the Persian Gulf on the south, with Arabia on its west, and the limit between lower and upper Mesopotamia on the north. Chaldaea seems to have been divided into a northern portion from Hit to Babylon, and a southern portion from Niffer

to the shores of the Persian Gulf. In each of these there seems to have been a tetraarchy, viz, Babel, Erech, Accad and Calneh, in the land of Shinar (Gen x 10) and Hui, or Hunk, Nipur and Laisa, or Larancha, which seems to be the scriptural U¹ of the Chaldees, Erech, Calneh and Ellasar. The northern tetraarchy was Babel or Babylon, Boisippa, Cutha and Sippara, the last the Sepharvaim of Scripture. A Semitic or Aramaic race is usually supposed to have early occupied the great alluvial plain at the mouth of the Euphrates and Tigris. They called themselves Aiam, and the Greeks called them Assyrians or Syrians, and Niebuhr regards the early inhabitants of lower Mesopotamia as pure Aramæans closely akin to the Assyrians, from whom indeed he regards them as separated only politically, and this view is taken by Bunsen and Muller, but Professor Rawlinson (1 54) regards as correct, the scriptural statement that they were Hamites, Cushite or Ethiopian. The first Babylonish dynasty began B C 3784, by a powerful Chaldee kingdom in Southern Babylonia and the historical city of Babylon is supposed to have been built B C 3250. The Chaldee Dynasty lasted for 1550 years, till B C 2234, when Babylon was taken by Zoroaster, a Mede, who then founded there the second Babylonian dynasty. The Median dominion ended B C 2011, after a rule of 224 years. The Chaldee were on several occasions the dominant race. The term Chaldæa, is derived by Pucok from Knla a tribe and deva god or brahmin. Chaldæans were undoubtedly the first people who dwelt in cities and formed a nation in the south of Persia. They settled in Mesopotamia, but it is supposed that they originally came from near Ararat and that they had spread northward towards the Canaanian range, where they engaged in astronomical pursuits.

The temple of Belus, the sun-god of the Babylonians, in the city of Babylon, was built about B C 3500 or B C 3250, in the era of the largest pyramid, but five centuries before the pyramids generally. This temple was built many thousand years after, and was quite distinct from, the watch tower mentioned in Genesis. The temple of Belus, was in the centre of the city of Babylon and was the vastest monument in Babylon and the world, and seems to have been erected 323 years before the birth of Abraham. It was a temple but also meant as the watch tower of Babylon. On the Euphrates, about 70 miles below Hit is the modern castle of Felujah, situated 29½ miles W. 2° N of Baghdad. The average width in this part of the river de-

creases a little, being only about 250 yards with an ordinary depth of 20 feet, and there is a current of less than two and a half miles per hour in the flood season, when the river forms thirteen islands, without wood. Above Felujah, at 5½ miles S 60° W from it, the derivation, called the Saklawiyah, takes place. This stream crosses Mesopotamia by a tortuous eastern course on the north side of Akai Kuf, and enters the Tigris at a point five miles below Baghdad, but, until altered by Daud Pasha to avoid the danger of inundations, it joined the Tigris a little above the city. The distance from river to river, by the course of the Euphrates steamer in passing, under Lieut Lynch, in 1838, is about 45 miles.

Mesopotamia, in latter times, was composed of the territories of ancient Babel, the Aiam Nahian, or Syria between the two rivers, of Gen xiv 10, Dent xxiii, 4, also called Padan-Aram Gen xxviii 2, meaning Champagne Syria. Ancient Babylonia is the modern Irig-i-Ajam, the modern Irak-i-Arabi of the Persians and the Al Jazira or the "Island" of the Arabs. It was anciently called Shinar, from the Hebrew word for two and "ai" or nahi, a river. It is that part of the present pashalik of Baghdad, which lies between the widely sweeping currents of the Tigris and the Euphrates, includes the boundaries of Babylonia and Chaldea. Mesopotamia lies between the outer limits of the Syro Arabian desert, and the foot of the great mountain range of Hindustan and Saristan. The Aramæans, were a Semitic race of highlanders who first settled on the upper part of the Euphrates and Tigris districts, and then passed through Mesopotamia proper (Aiam of the two rivers,) the low land (where is Mash-Mons Masins) which falls gradually towards Syria, afterwards called Aram. The name of Uz, in Nejd, proves that its off-sets extended as far as North Arabia. The Chaldee was an Aramaic dialect, differing but slightly from the proper Syriac. Ezia iv, 8 to vi, 8 and vii, 12-26, Daniel ii, 4 to vii 28 and Jeremiah x 10 are written in the so called Chaldee. There is also a Chaldee gloss in Genesis xxvi, 47. The Babylonian language in the time of Nebuchadnezzar was very close to Hebrew. The Chaldee language may have been that of Terah, but the possibility of the language of Abraham remaining in its original state during the 215 years that he and his family resided in Canaan, and the 430 years that the Hebrews abode in Egypt, and the 400 years from the Exodus to David, is untenable. *Rawlinson, Vol 1 p 2 — Colonel Chesney's*

MESUA, a genus of plants of the natural
order Cnisiaceae of which two species occur
in the East Indies, and a few other trees of
this genus remain to be determined Pynaer?
TAM, according to Dr Gibson, is the Mala-
bar name of a species of Mesua, and it gives
one of the finest woods he had seen
Mr McIver sent to the Madras Exhibition of
1855, a wood called Iio l maram, from a
species of Mesua, common, in the Nelam-
boie jungles much used by the natives
for building purposes durable and not liable
to be attacked by insects The Mesua,
in Ceylon called "non wood-tree," though
not large, has an erect symmetrical figure,
whose deep evergreen foliage flowing
downward from its cone-shaped crest, quite
conceals its bowering branches, so that when
covered with its rich blossoms, with ivory
white petals and deep yellow stamens, it
looks like the royal unibrella bespangled
with gold, and the Burmese say that their
next Budha Atee-ma-taya, will enter the
divine life while musing beneath its hallowed
shades, hence it is a favorite tree with the
buddhist priests of Burmah, who plant it
around their monasteries In Sanscrit it is
called nagakeshua, and Sir William Jones
remarks that "this tree is one of the most
delightful on earth, and the delicious odour
of its blossoms justly gives them a place in

MESUA FERREA

the quiver of Camadeva the Hindoo god of
love" To this Moore alludes in the follow-
ing stanza,

"Then rapidly, with foot as light
As the young musk roe's, out she flew
To cull each shining leaf that grew
Beneath the moonlight's hallowing beams,
For this enchanted wreath of dreams,
Anemones, and seas of gold
And new blown lilies of the river,
And those sweet flowerets that unfold
Their buds on Camadeva's quiver"

There are at least two different species in the
Tenasserim Provinces, *M pedunculata* and
M ferrea but much confusion exists in
standard works on botany in relation to this
last species The Mesua ferrea of Roxburgh
is the *M Roxburghii* of Wight's illustrations
the Mesua tree of Calcutta, Serampore, and
neighbourhood The *M ferrea* of Wight's
Prodromus is the *M Coromandelina* of
Wight's *Icones*, and *Illustrations* The *M*
ferrea, of Wight's *Illustrations*, is the *M*
nagaha of Gardener, the mesua tree of
Ceylon, while the *M ferrea* originally
described by Linnæus is probably the species
found on the Co omandel coast, but, for the
lack of books which contain the description
of Linnæus, it cannot be affirmed with
certainty — *Reverend Dr Mason. Dr Gibson*

is wild in Tenasserim and common about
Galagama

It is always planted near temples in Cey-
lon, as an ornament, because of its broad,
violet perfumed flower, the outer leaves of
which are white and thin, centres a deep
maoon, it has a graceful shape, with dark
polished green foliage, and brilliant red
young leaves and shoots Its white flowers
have yellow filaments and are used by the

METALLIC MIRRORS

native physicians, being supposed to possess medicinal properties Indian poets say that it forms one of the darts of Kama Deva. The blossoms are remarkable for their fragrance, and are sold in the bazaars of India under the name of Nagkesu. Sir William Jones says that the delicious odour of its blossoms justly gives them a place in the quiver of Kamadeva, the Hindu god of love. It flowers in the beginning of the warm season. The wood is very strong and tough. In a full grown tree on good soil, the average length of the trunk to the first branch is 20 feet, and average girth measured at 6 feet from the ground is 5 feet. A cubic foot weighs lbs 69. The wood is said to be used for furniture. The dried anthers are fragrant, the flowers and leaves are used in Bengal as antidotes to snake poison. Its oil promises to be valuable if it can be obtained in sufficient quantities. The seeds are contained in a strong brown skin, one, two or three in each. When ripe the skin bursts and the seeds drop out. The seed is covered with a hard shell. The oil is an excellent remedy for cutaneous diseases, dried buds, considered a temperate remedy used in coughs especially while attended with much expectation.—*Robburgh Fl Ind Irvine Gen Med Top* p 199 *Powell Hand Book*, Vol I, p 333 *Sir W Jones, Ann Mat Med* 1813, p 163 *Dr O'Shaughnessy*, p 230, *Dr Gibson, Dr Brandis, Cal Cat Ev* of 1862, *Dr Mason, Mr McIver in M E J R Mr Mendis, Master Carpenter Thw, Enum Pl Zeyl I* p 50 *Eng Cyc Vol II* p 5 *Cal Cat Ev* 1862

METAWALI

METAL CASTING, in India, is very largely practised, and the processes are of great simplicity. The natives generally prepare a model in wax, which is embedded in moist clays, which, after being dried in the sun, is heated in the fire, the wax run out, and the metal run in. A much better plan, where accuracy is required, as in casting a brass nut or box for a large screw, is to cut the model in lead, and, having bedded it in clay, it may, when the mould is dry, be melted and run out, and the metal run in. Wax models allow the moulds to shrink in drying, and the thread of a screw box so formed, of course does not correspond. The best specimens of native casting Mr Rhode had seen, were a set of figures cast at Pottapore, about A.D 1820, for the zemindar, who had whole armies of such in bronze. In Munbhoom, in Chota Nagpore, much ingenuity is displayed in the mode of casting articles of this kind in hollow net work, &c. A core is made of plastic clay, all carefully shaped to the internal form of the fish or other object to be imitated. This core is then baked and indurated. On this, the pattern designed to be represented is formed with clean bees' wax. This done, and the wax having cooled, it becomes tolerably hard. Soft clay is moulded over all. The whole is then baked, the heat indurating the outer coating of clay, but softening the wax, which all runs out of the mould, leaving empty the space occupied by it. The mould being sufficiently dried, the molten brass is then poured into the empty space, and, when cool, the clay is broken away, when the figured casting is seen. These are untouched after the casting, excepting on the smooth and flat surfaces which are roughly filed. The Chinese excel in all working in metals, in ordinary blacksmith work, metal smelting, alloys, particularly their white metal of copper, zinc, iron, silver and nickel, their sonorous gongs and bells, one at Peking being 14½ feet by 13 feet, and their ingenious metallic mirrors, some with engravings. The consumption of metals from abroad, by the Chinese depends very much on their price, for when high, their own mines furnish them cheaper. They have mines of lead, quicksilver, iron, and c lamene, and probably of tin and copper.—*Mr Rhode MSS Calcutt Cat Ex* 1862 *Morrison*

METEMPSYCHOSIS, or Transmigration of the soul is believed in by the hindoos and budd'hists of Asia, and by all the pre-Aryan races in British India. The metempsychosis doctrine seems to have been held coeval amongst the brahmans and Egyptians. The Pythagorean sect of Magna Grecia seem to have derived it from Egypt. In the Institutes of Menu, at least thirty different creatures are named into whose bodies malefactors are imprisoned according to their crimes, the scale descending down to such particulars as that he who stole perfumes should be changed into a musk rat. Metempsychosis is the idea that a human being guilty of sensual sins, should be changed into animals that is only conscious of the senses. But metempsychosis, according to Bunsen is the recognition that there is a solution of the enigma of existence, which is not to be found in the term of a single life on earth, and yet which we are impelled to seek after, in order to explain this life. All guilt must be expiated, but the final issue, though reached only after the lapse of unnumbered ages, will be the triumph of the good, the general reconciliation, and a life in God will be the eternal heritage of the soul. Thousands of years before christianity announced the certainty of immortality, the three civilizations of the Egyptians, the brahmans and the Druids believed that the human soul died not after death. Abn Zaid the historian writing in A D 916, mentions that in Ballahia and other parts of India, men burned themselves on a pile influenced by their belief in a metempsychosis, and he adds that when a man or woman become old, he or she begs that they may be thrown into the fire or into water. The Tibetan buddhists count six classes of existence, viz, four bad, those in hell, the brute, asur, and yidag, and two good those as man and God — *Fraser's Journ May 1868 Bunsen Elliot's History*, pp 1-9 *Haughton's Menu* p 406

METEORIC FIRES The Shahaba, or wandering meteoric fires, on fields of battle and in the places of "great sacrifice," produce a pleasing yet melancholy effect, and are the source of superstitious dread and reverence to the hindu, having their origin in the

METEOROLOGY

same natural cause as the "wandering fires of Odin," the phosphorescent salt produced from animal decomposition — *Tod's Rajasthan*, vol I, p 74

METEOROLOGY, An interesting meteorologic point is the condition of atmospheric pressure during the monsoons. The course of the local monsoons is determined by the existence of alternately high and low atmospheric pressure over the country. This centre of minimum pressure, is, as it were, a point upon which the wind turns, or it is the goal towards which the wind blows, while the place of greatest pressure is the point from which the winds diverge. To find out these two points and to discover the relative position which each will take up at the change of the monsoon, in the months of March, April and October, is of primary importance. As the determination of these points gives the general character to the monsoon in each locality, so the irregularities, the exceptions to the rule, give a distinctive character to each season. For example, in 1868, a local depression in the north-west of the Bay of Bengal diverted the moisture-laden winds from Central and Northern India, and attracted an excessive rainfall towards Bengal west of the Delta and the northern part of Orissa. In 1869, the frontiers of Bengal were surrounded by a belt of low atmospheric pressure which shut in the rainfall, threatening to afflict the North-West with a second drought until an egress was found for the imprisoned clouds during September and October in a rise of pressure about Hazareebaugh. These local atmospheric irregularities complicate meteorological observation and throw out calculation. Probably the most striking evidence of this that can be brought forward is their misleading effects upon the determination of heights by the barometer. Thus the difference of Cuttack and Sangor islands, which is known to be only 74 feet, appeared from the barometric readings of 1868 to be 205 feet and from those of another year 166 feet. The track of cyclones, though of course not their occurrence, is influenced in a considerable degree by local depressions as was the case in the hurricanes of May, June, and October. Mr Blanford calls attention to the unusually high temperature during the first five months of 1869. The area west of the Gangetic delta, over which the low barometric pressure then prevailed, enjoyed a temperature equal to that of Nagpore, "the thermal focus of India." The hot winds blowing from the North-West and Central India were, however, interrupted by the region of low pressure at

Hazareebaugh and Mongyr At Darjeeling and Goalpara the temperatures were unusually low, and the cause suggested was the effect of the high temperatures over the country to the south of the Ganges. The local heating of the atmospheric pressure in the country south of the Ganges and west of the Delta, would arrest the north easterly progress of the hot winds and allow the free play of the cool breezes from Assam and the Snowy Range. Meteoric phenomena are not uncommon during Himalayan thunder-storms. From the humlets of Hungipoor, for instance, in one of the valleys at the southern end of Cashmere, was witnessed a thunder storm, of awful grandeur. The lightning shot in tremendous zig-zags across the mountain tops. One bolt struck a pinnacle of rock, and remained a globe of fire for upwards of two minutes. The rainfall has been given for four years at thirty-two different stations, at Dargia the highest fall in any one year was 125.1 inches and the average for the four years was 91, at Simla it was 68.2 and 57.9 inches. There are only three other stations at which the rainfall in any one year exceeded 40 inches, and at only two of these the average was over 40, while other stations seem to have almost as little rain as Aden. For instance at Multan in 1870, there was a fall of only 2 inches, and in the same year Jhung had only 3.4 and Dara Ghazee Khan 2.4, in 1868 Moozuffnugurh had only 2.8 inches, and in many places a fall of very much under 10 inches seems to be common. The average downfall for 1867 and 1870 (the first and last year given), notwithstanding the very heavy falls in some places, is only a little more than 20. Dr Neil lays down that "as a general rule, to which, however, there are frequent local exceptions, a rainy cold season is the precursor of a partial failure of rain in the proper rainy season." Experience would lead most people to the same conclusion. He also tells us that "the more rain the Southern Districts receive, the less falls to the share of those more to the north," which rule "would seem to hold good for the monthly amounts during the rainy season, more than for the annual falls," in other words it is not raining at all places at the same time, and the rain takes a certain belt of latitude at once, taking those to the north, or south of it also in belts at other times. We have heard the theory of belts of rain broached before, but we do not know that any well-organised observations on a large scale have ever been made, as they easily might be, to test its accuracy. In the

Panjab, June and July seem to be the hottest months. The highest monthly mean temperature in Lahore, Rawul Pindie, Dehra Ismail Khan and Syalkote during the four years 1867-1870, was, at the last station, in June 1867, when it was 96° 9, but Lahore in July 1870 comes pretty near it, and is 96° 1. The mean temperature is tolerably low, but there appears to be very great heat, and considerable fluctuation of temperature. At Lahore in May 1870 the maximum and minimum were 121° 5 and 61° 0 respectively, and from April to October the maximum ranges each month from 105° to 121° 5 and the minimum from 50° to 72° giving a variation of from 50° to 60°.

MEWA FAROSH, Pers A fruit seller, usually of the mudi caste, but in the Mahratha country brahmans and kalawant or sugers follow the business in towns, the fruit sellers in the villages are sometimes mahomedan gardeners

MEWAR The rana of Mewar, the capitals of which are Chitor and Udayapuri, is of the race who ruled in Santashtra After the destruction of the Balhara monarchy of Santashtra, and two centuries sojourn of the family in the Bhaider desert, Bapp or Bappi conquered Chitor, and founded a new dynasty, in AD 727 The hereditary title was changed from Gehlote to Aditya In 1528, Jewan (Javan) Singh, the only survivor of the race of Bappa, was on the throne Mewar, is a rajpoot kingdom, of the Suriya vansa race, the chieftan of which is styled rana and he dwells in the capital Chitor The rana is admitted to be the descendent of Rama, who reigned about seven hundred years before the christian era Rama was the chief of the Solar dynasty and Mewar is the most ancient but not the most powerful house of Rajputanah, there being no doubt that they have reigned there upwards of 2000 years The Mewar state was much exposed, and was overrun successively by Mahomed of Ghazni, and the emperor Akbar who in 1568, destroyed its capital of Chitor The rana took refuge in the Aravalli mountains, and founded Odeypore the present capital Baba is a term applied to the descendants of Oody Sing, the rana of Mewar He lived for four years after the loss

of Chitor, and expired at Gegoonda, aged forty-two He left a numerous issue of twenty-five legitimate sons, whose descendants, all styled Ranawut, pushed aside the more ancient stock, and form that extensive clan distinctively termed the Baba, or 'infants' of Mewar, whether Ranawut, Pootawut, or Kanawut His last act was to entail with a barren sceptic contention upon his children, by setting aside the laws of primogeniture and proclaiming his favourite son Jugmal, his successor The rana of Mewar, is the dewan, or vicegerent of Siva, and when he visits the temple of Eklinga, he supercedes the high priest in his duties, and performs the ceremonies

The shrine of Eklinga is endowed with twenty-four large villages from the fisc, besides parcels of land from the chieftans The hills of Mewar and the neighbourhood are, however, still held by aboriginal tribes The Mewar ruler is styled rana, and is the elder branch of the Sooryavansi, or children of the sun Another patronymic is Raghoovansi, derived from a predecessor of Rama, but Rama is the focal point of each scion of the solar race To him, the conqueror of Lanka, the genealogists endeavour to trace the solar line The titles of many of Rajput claimants are disputed, but the hindu tribes yield unanimous suffrage to the prince of Mewar as the legitimate heir to the throne of Rama, and style him Hindua Sooraj or 'sun of the Hindus' He is universally allowed to be the first of the 'thirty-six royal tribes,' nor has a doubt ever been raised respecting his purity of descent Many of the royal tribes have been swept away by time, but the genealogist, has filled up their place with others, mere scions of some ancient but forgotten stem With the exception of Jessulmer, Mewar is the only dynasty of these races which has outlived eight centuries of foreign domination, in the same lands where conquest placed them The rana still possesses nearly the same extent of territory which his ancestors held when the conqueror of Ghazni first crossed the 'blue waters' of the Indus to invade India, while the other families now ruling in the north-west of Rajasthan are the relics of ancient dynasties driven from the pristine seats of power, or their junior branches, who have erected their own fortresses This circumstance adds to the dignity of the rana of Mewar and is the cause of the general homage which the ranas receive, notwithstanding diminution of their power Se-odia is the last change of name which the ranas of Mewar race have undergone It was first

MEWAR.

[illegible]

Loonawut, and Ranawut, distinctly show from what stem and when they branched off, and as they ceased to be of sufficient importance to visit the court on the new and continually extending ramifications, they took to the plough. But while they disdained not to derive a subsistence from labouring as husbandmen, they never abandoned their arms, and the bhoomia, amid the crags of the alpine Aravalli, where he pastures his cattle or cultivates his fields, preserves the erect men and proud spirit of his ancestors, with more tractability, and less arrogance and folly, than his more courtly but now widely separated brethren. They form a considerable body in many districts, armed with matchlock, sword and shield. In Mandelgurrh, when their own interests and the prince's unite, four thousand Bhoomia could be collected. They held and maintained without support the important fortress of that district, for their prince, during half a century of turmoil. Aravalli, according to Colonel Tod means the refuge of strength, its hills have afforded protection to the most ancient sovereign race in the east or west—the ancient stock of the Suiyavansa, the Heladæ of India, or children of the sun, the princes of Mewar, who, when pressed were wont to retire to its fastnesses, only to issue again when occasion offered. The Aravalli hills are connected by lower ranges with the western extremity of the Vindhya mountains on the borders of Guzerat, and stretch northwards to a considerable distance beyond Ajmer, in the direction of Delhi, forming the division between the desert on the west and the central table-land. It would be more correct to say the level of the desert, for the south eastern portion including Jodpur, is a fertile country—*Prinsep's Antiquities by Thomas*, p 248-258 *Tod's Rajasthan* Vol 1 pp 10, 12, 13, 136, 154, 163, 164, 169, 172, 198, 211, 212, 516, 517 Vol 11 p 141 *Elliot Supplemental Glossary* *Elphinstone's History of India* Vol 1 p 2 *Campbell*, p 80 *Wilson's Glossary*, *Howell Thulow* p 156 See Bal, Choitunya, Hindoo, India, Inscriptions, Jain, Kalapatta Saurashtia Shur Sumitia Tripati Kush or Cush Lat Math, Rajput, Rudia, Sampradaya.

MEVAS a Koli tribe of freebooters in Guzerat

MEWAT A district S W of Delhi, notorious for the lawless habits of its inhabitants, a very ancient hindu race, but the greater part forced proselytes to the mahomedan faith. In the time of Pithura the chief of Mewat was one of his vassals. The

whole of its towns were levelled to the ground by Jessaj. The Mewati is a tribe of Rajputs inhabiting the province of Mewat, now known as Macheri, and formerly notorious for their turbulent and predatory character. They are a thieving tribe of cultivators found here and there along the S West borders of the N W Provinces of India. The Alwar country near Delhi seems of late to have been called Mewat, but they extend further east than the Gujar and in Malwa are common as irregular soldiers and depredators. They are supposed to be mostly mahomedans. The turbulent Mewati of Alighur form a large element in the population. A punishment was inflicted on the Mewati tribe, which inhabit the hilly tract, within 25 miles of Delhi. In 1265, 100,000 were put to the sword, and a line of forts was constructed along the foot of their hills. The Mewati mahomedans partake of both religions. Though stigmatized as robbers and assassins, they are at the same time admitted to be faithful and courageous guards and servants to those in whose service they engage. In Hindustan, they were entertained as sebundies, or militia, by the renters and managers of the country, and were deemed faithful to those they served, but great numbers of them who settled in the villages became professed depredators. They were, however, generally, in bodies which Rajpoot lords and wealthy landholders could alone afford to maintain—*Malcolm's Central India*, Vol II, p 174 *Rennel's Memoir*, p xlii *T of H* Vol 11 p 126 *Campbell*, p 103 *Tod's Rajasthan* Vol I p 169, 498.

MHAIR The Mhanwara country is situated but a very few miles west of Ajmer and is composed of successive ranges of huge rocky hills, the only level country being the valleys running between them. Either from the insignificance or sturdy valour of this race, the rulers of India were never able to make any impression on them, notwithstanding their vicinity to the occasional residence, for a long period, of the emperors of Hindustan. In later times the Mhair have been the terror of their lowland neighbours, and even the Rajpoots, perhaps, with the sole exception of the Rohilla, the bravest men in India, dreaded their approach. The Mhan of the Mhanwara hills occupy the Aravali range running towards Ajmer. Their chiefs claim to be of Rajput descent, but the Koli assert their relationship to them, and they admit having intermarried with the Bhil and Meena, and Colonel Dixon says that for hundreds of years, they have been recruited by refugees and all sorts of rascals from Hindustan, and are now probably a very mixed race. They are described as rather good looking. Colonel Briggs states the Mahatta and Mhan names have a similar origin. The Mhan claim never to have been conquered, nor to have paid tribute to the thakurs of Khairwa or Mussoora or to the bhoomahs of Mewar. Some of them remonstrated against being handed over to Joudpur and the people of a few villages which had been transferred migrated to British territories. The Mhan race, amongst whom the latter part of Colonel Dixon's career was passed is one of the bravest and amongst the most predatory of the Non-Aryan races in India, and Colonel Dixon's efforts were directed to civilizing them. Gradually they

became attached to industrial pursuits. Col Dixon built a new town, strong and well planned, with two miles of wall as a defence and encouraged strangers of various castes, particularly that of shopkeepers and bunnahs to settle in its capital, a readier means of buying and selling being two of the great wants of the young community. Up to A D 1838, the district was wholly dependent on supplies brought in (chiefly by plunder) from a distance. But by 1850 the population had much increased, and exported to surrounding towns and villages considerable supplies of produce, and the sounds of honorable industry were heard not only in the vicinity of Nya Nuggui, but in three or four hundred villages erected in the midst of the jungle. Civilization dawned on the face of those long-tionbled hills in some of its most benignant forms — *Cole Myth Hand p 299, Campbell p 45* See Man, Med, Meena

MHAN BIN, BURM Morinda

MHANG, a helot race mostly predial slaves amongst the Mahatta villages, employed as the scavenger, guide, watchman, and executioner. They take the place of the chakli or chuckler amongst the Tamil race.

MHAR, The Mhar of the Mahrati-speaking countries, is undoubtedly the Dheri of the Dekhan, the Hohai of the Canarese, and the Pariah of the Tamil people. Throughout the Hyderabad dominions, most of them have claims for allotments on the cultivators, though the Mhar does not, or only rarely cultivates, on his own account. There are 230,772 Mhar or Dheri in the Berars, or about a ninth part of the Berar population. Professor Wilson, writes the word Mahar, Mhar, Mber, Mhao, Maw and Mai. They are regarded by Hindus as lower than the Dheri, but the Mhar, Dher, Eskar, Hohar, and Pariah are undoubtedly one people. They are to be met with throughout the Mahatta country, dwelling apart outside the village, and are often part of the Baloth. The mark for their signature is a staff. They are a willing, ready people, obliging, grateful for any little kindness, and, for the traveller, whether at midnight or midday, in sun or rain, or cold or heat, they take up their staff and move cheerfully along to show the road to the next village. Indeed, in the great tract of the Central Dekhan, the Dheri, or Mhar and the Mhang, are the only free labourers, for the Hindu farmers rigidly prevent them holding land, and with equal tenacity prevent those of the hamlet leaving it lest the farming villages lose their labouring hands. They

are really village slaves throughout the Hyderabad territories, but claim certain ancestral rights. The Dheer or Mhar, and the Mhang of the road-side hamlets earn a little as beggar coolies or labourers whose services travellers can claim to carry loads, but the usual payment, and what they themselves demand, is only an anna for four cos (or 8 miles), and, with the recent increased prices of all supplies, their means must be insufficient. They all said so, and their clothing indicated insufficient purchasing means. Their personal appearance did not evince any insufficiency in food. But, an increase in the beggar payments seems advisable, particularly for such as dwell on lines of much traffic, and in any arrangements for village conservancy or protection from small-pox, these non-hindu communities should be carefully included. The Mhang and Mhar dwell on the outside of every village and hamlet of the peninsula of India, as the pedial or village slaves. They are called by Mr Campbell, a helot race, and are generally regarded as part of the Non-Aryan peoples of India, of which there are upwards of twelve millions in British India. The Mhar or Dheer or Pariah is free spoken, intelligent, well informed, considering his position, and has large and liberal views as to religion and policy. The brahminical religion, however, whether of the Saiva the Vaishnava, or Vira-Saiva types has never recommended itself to them, nor have they taken to mahomedanism, or to christianity. They are decided shamanists, nature-worshippers and spirit worshippers, and though living in hourly communication with the Hindu, Brahmin, Kshatriya, Vesya and Sudra, they have not adopted any hindu tenets but seem to have imparted to the hindus several shamanist customs. From the great numbers of the Chamra or leather worker race of northern and Central India who have joined the Sadh-Nama sectarians, theistic teachings would seem to be the more acceptable to the Non-Aryan populations of the central parts of India. See India.

M'HLECHA The Arians seem to have brought with them a servile race, or to have had amongst them a social distinction between the noble and the common people which has ever continued up to the present day. As they conquered southwards, amongst the Tartar races whom they found in the country, they reduced them also, every-

where to a state of slavery. They named them in fierce contempt Dasa or slaves and these formed the true servile race of Menu and other writers. Where the races who had preceded them retained their independence these proud immigrants styled them M'hlecha, a term which even to the present day, is intended to comprise every thing that is hateful or vile. To all these prior races, the Aryan immigrants applied the most contemptuous expressions, Dasa, slave, Dasya, country people, Locust-eaters, Hole-dwellers, Rejectors of India, Monkey-tribes, Snakes, but the term most frequently used is M'hlecha. This name, now used to designate any person other than a hindu, long continued to be applied, to all the unsubdued Non-Aryan tribes in India. But many of the aboriginal Scythian inhabitants of India seem to have been subdued and transformed from Mlechha into Sudra, by slow degrees and the process is everywhere yet in progress. In the age of Menu they retained their independence and the appellation of M'hlechha, in Bengal, Orissa, and the Dekkan, but in the earlier period which is referred to in the historic legends of the Mahabharata, the M'hlechha and Dasya are mentioned as disputing the possession of Upper India itself, with the Aryan race and in conjunction with certain tribes connected with the Lunar line, they succeeded in overrunning the territories of Sagara the thirty-fifth king of the Solar dynasty.

MHYE, in Guzerat, a broad fine stream. It attains in Malwa no great size or body of water, it has its rise in a small plain five miles west of Amheria, and shortly after passing Bhopawar, pursues a northerly course till it reaches the upper confines of Bagai, where the boundary hills give it a sudden turn westward past Mongana. It is, however, soon diverted from this direction by the high primary mountains of Mewar, which bend it south, and this course it pursues, with little deviation, till it falls into the sea in the Gulf of Cambay, near the town of that name. This river is not deemed navigable above twelve or fifteen miles from its mouth, owing to its numerous shallows.

MHZUNGU, See Somal

MIAKO, a town in Japan, Fudsiyama is a high volcanic mountain of Japan, at pre-

sent inactive, but which tradition reports to have risen in one night, and, as it rose, there occurred a depression in the earth near Miako, which now forms the lake of Mit suno-nmi. In A D 864, the mountain burst asunder from its base upwards, and at its last eruption in 1707, it covered Yedo with ashes. It is a sacred mountain. It is crested with snow, and presents the appearance of a truncated cone, and the gathering of a white cloud around its summit, is a sign of bad weather. It is occasionally ascended by Japanese pilgrims for the worship of the god of the winds. The religious and supreme emperor who lived at Miako had twelve wives and twenty-five other consorts. Neither the hair of his head, his beard or his nails were ever cut. All his victuals were prepared in new vessels, which were broken after using them, and his garments renewed daily were also daily destroyed, to prevent any others using them. When he went abroad, he was carried in a palanquin, from whence he could see without being seen. This supreme emperor alone lived in polygamy, all the people having but one wife.—*Japan*, pp 409-411. See *Japan*, Kio-kobo.

MIANA a predatory race in Cutch. The Miana of Malha in Mucha-Kanta on the banks of Mucha river, are the real masters of Mulha. They have a thakur, but own allegiance only to their own chowhatia or heads of tribes. They are turbulent, take service as soldiers in the neighbourhood, and in every boundary fight, a Miana or two is killed.

MIANA or Mar, or Miani or Moana, a tribe at Khyipor in Sind, subsist by fishing, their women are on a very large scale, thick-set and dark, few of them handsome, they wear ear and neck ornaments of unseemly size. In marriages and other festivals men and women join in the dance. The women form a circle round the musicians, move in slow time beating the ground with their feet, and clapping their hands which they raise above their heads. The Miana tribe of fishermen and boat-men, find occupation and subsistence on the river Indus. The Miana, though it is usual to style as Sindhians all classes generally who inhabit the country, as hitherto observed by all travellers passing through it, form a third of the mahomedan population of Sindh, and form a large tribe, apart from either the Jutt cultivator or the turbulent Biluchi. The Miana or Miani are the most active and athletic race in Sindh, with a buoyancy of spirits and generally frank bearing unknown to the other classes. Many of them as fishermen live, it may be said, in, rather than

on the river, but all have villages immediately on its banks, their boats and nets furnishing all that is required for their maintenance. In many parts of the stream, especially near the great lake Munehm, whole families of this class live entirely after the Chinese fashion in their boats, having no other habitation. The women share the labour equally with the men, and a sturdy lass is generally seen steering or paddling the boat whilst the man works at the nets, a child being often suspended in a net-work cot between the mast and rigging of the craft, which is always very small and light for the advantage of easier navigation amongst the shoals and creeks. The navigation of the Indus is carried on by the Miana, and passing his life on the river he is the only pilot to be trusted in its intricate channels. The Pullah fishery, for which the Indus is so celebrated, is conducted by this people. First placing on the water a large earthen vessel and commending it to the care of Allah, the fisherman casts himself on it in such a manner that the mouth of the vessel is completely closed by the pressure of his stomach, he then paddles himself by means of the action of his hands and feet into the centre of the stream, holding deep in the water a forked pole about fifteen feet in length, to which is attached a large net, in his girdle he carries a small spear, and a cheek-sting attached to the net indicates the moment when a fish is entangled. The spear is used to kill the fish when drawn up after capture, and the jur receives the spoil. The Miana, are poor though exceedingly numerous. They are dissipated, and a large proportion of the courtesans and dancing women of the country are from this tribe, they are of very dark complexion, but possess regular features, and some of the women would be considered remarkably handsome. The Miana are also noted for the manufacture of mats and baskets, which are beautifully woven from the high reeds and strong grasses growing on the edge of the river. The Miana, when found near towns and villages, occupy a distinct quarter, generally outside or apart from the other inhabitants. Here they sell spirits, the men beat drums and sing and the women dance and perform all the usual acts of courtesanship calculated to allure the passing stranger.—*Postan's Personal Observation*, pp 58, 59, 60. See *India*, Kattyawai.

MIANEE, a battle was fought at this place by Sir Charles Napier against the amirs of Sind, and won on the 17th February 1843.

MIANNA a town situated in a wide valley, closed to the south-east by the lofty moun-

trains of the Kottan-Kou It is a poor place, being best known by the ill-name of its bugs—*Porter's Travels*, Vol I p 265

MIAOU-TSE, also written Miao-tse, and said to mean children of the soil and similarly in Chinese we have Yan-jin, deg-men, Man-jin, savage-men, Hungmin, red family Peh-ko-lo white kole The Maou-tse are an aboriginal race or races in the hilly parts of China, and are divided into the Black and White Miao-tse They have various tribes with separate names The white Miao-tse, who occupy the hill country of central China, present many points of resemblance to the Kien They are brave, independent, and at certain intervals sacrifice in or without blemish to the Great Father It is amongst the Miao-tse that the old Testament is said to have existed from time immemorial, which they say came to them from heaven 2000 years ago See India

MIAS JAV or Orang-utan Mias occurs in Borneo, are species of Pitheciens One kind called "Mias-chuppan or Mias pappan has the skin of the face broadened out to a ridge or fold at each side One killed by Mr Wallace was 7 ft 3 in across the arms and 1 ft 2 in from head to heel The small Mias is called by the Dyak race Mias kassu The orang-utan in Borneo, lives in the low swamp in forests Their food consists of fruit, with leaves, buds and young shoots They rarely descend to the ground The Dyaks say that only the crocodile and python will attack the orang-utan When fruit is scarce it goes for food to the banks of rivers and the sea, and the crocodile tries to seize it, but it gets on the crocodile, beats him with its hands and feet, tears him and kills it by main strength, tearing open its jaws and throat The Python, it seizes and bites and kills The orang-utan is confined to Borneo and Java A full grown mias is quite a match for a naked man, and generally before he can be killed contrives to bite off two or three fingers or otherwise maim the individual Many Dyaks are to be seen thus mutilated by them—*Wallace* I pp 54 and 60

Yin sing shih,	"	Abraka,	SANS
Abiak,	HIND	Abiakam,	TAM

Several varieties of this mineral are found in India, especially in Behar, and in the Northern Circars It readily splits into transparent, elastic flakes It consists of nearly equal parts of silica and magnesia, and about 6 per 100 of lime Slips of mica afford a convenient substitute for platinum foil, in chemical experiments on the effect of heat on organic bodies and they are useful for covering photographs Mica occurs usually in thin tabular plates or scales, resembling glass, it is rarely crystallized in form of six-sided short prisms or long six-sided pyramids It melts before the blowpipe into a greyish spongy glass, it is soft, pliant and easily scratched, its colors are white, yellow, brown and black Sp gr 2.651 In China, mica is used medicinally The principal Mica mines of Behar, are situated on the northern face of the Vindhya hills, where the three districts of Behar, Monghyr and Ramghur meet The most westerly mine is situated thirty-seven miles in a south easterly direction from Gyr, and is in the district of Behar the most easterly mine is about sixty miles distant in zillah Monghyr, the whole of the intermediate sixty miles being more or less productive of the mineral The average distance from the Ganges of the whole aggregated group of mines is sixty miles Those mines only which lie within the boundary of the district of Behar are worked, those within the district of Monghyr, from some unknown reason, are neither worked nor regarded as of any value by the owners of the estates in which they lie The mica reaches the surface in three different states, viz the good, hard and serviceable mineral, the soft, wet and flimsy mineral and the chipped and powdered mineral The tests as to whether the mica is good for any thing, or whether, as the natives say "it is alive" are its firmness, specific gravity, and the power of reflecting the countenance free of contortions, the latter test showing the perfect parallelism of its individual plates and consequent likelihood to split well, the heavier the mineral and the more perfect the reflection, the more valuable is the mineral considered, all the plates not standing the necessary test, are of a soft and flimsy nature without any of the brilliant sparkle of the better sort, the natives call this the "dead mica," and it appears to be in a state of decay The plates of the superior kind are

MICHELIA CHAMPACA

used in all the large Gangetic cities and towns, by the native draftsmen, whose beautiful productions in body colours, must be familiar to most people by the lamp and toy makers, by the mahammedans for ornamenting their taziah or tsboot, as well as for ornamenting umbrellas, and boats, and for making artificial flowers. The second and third kinds are pounded and used for ornamenting toys, pottery, the inside of houses, for sprinkling over clothes and turbans at feasts, the sparkle from which by torch light resembles diamonds, but the great consumption of the inferior mineral takes place during the Hooli festival, during which period the "abn" or pounded mica mixed with the flour of the small grain, Kodu, *Paspalum stoloniferum*, Linn, and colored with some red coloring matter is freely sprinkled over the votaries of those bacchanalian orgies. It is the soft shining scaly part of granite and is very liable to decay from constant damp, it passes into a greasy or soapy earth or loam. Mica is mixed with lime to form a beautiful glistening plaster, for native buildings. Mica is exported from Bombay in considerable quantities. In the year 1861, five tons of the value of £ 146 were exported—*Capt Sherwell, Revenue Survey Beng As Soc Journ* No 1V, of 1851 *Cat Br* 62 *O'Shaughnessy*, p 694.

MICHELIA CHAMPACA.

Fruit

Chamaku HIND | Chamote HIND

A large tree of the Moluccas, of Java, of most parts of India, Ceylon and China. It grows in the Punjab at Kalka, and Kangia, and at Chumba at 2,000 to 3,000 feet and in Kangia, it was one of the padshahi royal or reserved trees. Those at Chumba are 7 or 8 feet in girth and 60 or 70 feet high. Ploughshares are occasionally made of the wood. In Ceylon it is used for diams carriages, palanquins and in buildings, it is prized for well works, verandah posts and for furniture, as it polishes well, though it is apt to warp. It is not subject to worms. It flowers and fruits nearly all the year and has large deep yellow intensely fragrant flowers. Doubts exist as to whether the Kalka, Kangia and Chamba tree is of the same species, as *M. champaka*, but the wood is used for the same purposes. In China its bark is used with that of other magnoliaceae to adulterate cinnamon.

The flower

Shamboogha poo TAM | Bangas jampacca MALAY.
Chumpeki phool DUK | Shumpenghi poo TEL
Shimpakam HORT MAL | Champac SANS

This beautiful golden coloured flower is held in high estimation by the hindoos, by whom it is dedicated to Krishna and is one of five with which the hindu "Kama," the god of love, ornaments his arrow. When Vasant'ha the personified spring time, is preparing the bow and shafts, for his friend,

He bends the luscious cane, and twists the sting
With bees how sweet! but oh! low keen then sting!
He with fine flowerets tips the ruthless darts,
Which through five senses strikes enraptured hearts,
Strong Chumpa, rich in odorous gold
Warm Ameri, nursed in heavenly mould,
Dry Nag Kesur, in silver smiling,
Hot Kittikum, our sense beguiling,
And last, to kindle fierco the scorching flame,
Love shaft, which gods bright Bela name

Sir William Jones says its aromatic scent is so strong as to be offensive to bees, who never alight upon it. Rheede informs us that the powder of the bark of the root of this tree is given to excite the flow of the menses. It is from this tree that the aromatic Sumpunghee oil of Madras is obtained. It is one of the few trees embalmed in English song,

"The maid of India blest again to hold,
In her full lap, the Champac's leaves of gold,
Thinks of the time when by the Ganges' flood,
Her little playmates scattered many a bud
Upon her long dark hair"

Its rich orange exquisitely fragrant, blossoms, are used by Burmese maidens to adorn their "long black hair." The bark is

MICHELIA NILAGIRICA

bitter, and aromatic, and on several trials appeared to Dr O'Shaughnessy to possess the properties attributed to the *Magnolia glauca*. It may be given in powder in intermittent fevers in doses of from 10 to 30 grains. Its aromatic properties are dissipated by boiling either in water or spirit, and on evaporation, a bitter extract remains, which contains tannic and gallic acid—*Roxb Voigt, M Mendis Captain Macdonald Captain Puckle Dr J L Stewart Ans Mat Med p 157 Drs McClelland Mason O'Shaughnessy, p 193 Smith, Chin Mat Med*

This large tree grows in the Central province of Ceylon up to elevations of 3,000 to 8,000 feet. It is rare in the Walliar forests, being alpine in its tendencies, and is common on the Neilgherries. Dr Gibson had not seen it wild in the Bombay forests, though, in gardens and about dwellings, it is common. Its wood is strong, close, fine grained and straight, a pretty olive colored mottled wood, close grained, without being heavy, but too highly hygrometrical to be useful in other form than rafters or beams, it could be turned to account in house-building, and might with advantage be creosoted. It has yellowish white fragrant flowers. In Ceylon the most typical form of this plant is that called *M Walkeri* by Dr Wright. Its beautiful golden colored flowers, are held in high estimation by the hindoos, the bark of the

MICIPPE CRISTATA

root of the tree is used medicinally in some female complaints. At the Madras Exhibition of 1855, a plank from this tree contributed by Capt Cunningham of the Mysore Commission had the extraordinary dimensions (length 11½ feet, breadth 4½ feet, thickness 3 inches). The ornamental character of the wood, was well shown in that specimen, and was apparently from a tree of very great age—*Thwaites, Enumeratio Plantarum Zeylanæ, Part I p 5, Drs Wight and Gibson Wight III 5, Icon 938 M E, J R Roxb Dr Cleghorn in Jun Rep 862, Capt Puckle Roxb Voigt, Riddell*

MICHELIA OBLONGA *Wall* A tree of Khasia

MICHELIA SUAVEOLENS, the Champaca of Java, its small flowers are in much esteem by the Chinese women *Bennet*

MICHNEE MOMUND, Punpao Momund and Pindee Alee Momund. The Michnee Momund, after annexation, by the British were allowed to hold a fief or jagheer in Doaba, the fertile triangle near the junction of the Swat and Cabul rivers, from the British Government, of which they collected the revenue. They cultivated a portion of the lands themselves, the remainder they farmed out to other tribes of the plains as tenants. Many of their clansmen dwelt in the plains of Michnee and some in the neighbouring hills. They traded in the Peshawar valley. The Alumzye Momund, whose head-quarters are at Gundao, in the hills, also had a fief of Punpao in British Doaba, chiefly cultivated by tenants. A few of their men lived in the plains and the majority in the hills. These also traded in the valley. The Pindee Alee Momund, at a former period, had held a similar jagheer in Doaba, but not since British rule. These have few relations either with the British Government or the people of the Peshawar valley. They inhabit a very strong locality in the hills. The fiefs were originally granted by preceding Governments to the Momunds as black mail to buy off depredation, but molestation was not to be thus warded off, and the Doaba border was not free from Momund marauders. The misdeeds of the Momunds were encouraged by Saadut Khan, who had a grudge against the British for having been parties to his temporary deposition from power during the Affghan war. On the Momund frontier, there occurred, during the years 1850 and 1851, several audacious outrages.

MICRONESIA, a designation proposed by Mr Logan for part of the Indo-Pacific Islands The Indo-Pacific islands he names Oceanica

Under the term Asiamesia, he describes the great S E insular region, which has intimate geographical and ethnical relations with Asia, and which would include Indonesia, Melanesia, Micronesia and Polynesia Aino-Japanesia, is the name that he gives to the distinct and well defined geographic and ethnic N E chain that lies along the continent of Asia, and forms a group including the Japanese and Aino islands from Formosa to Kamshatka

The Indian Archipelago he also proposes to call Indonesia, and to arrange it thus,

Western Indonesia, including Sumatra, the Malay Peninsula, Borneo, Java, and the intermediate islands

N E Indonesia, Formosa to the Solo Archipelago and all included, and embracing the Philippine and Bisayan groups, &c The Southern chain of this has a close ethnic relation, and is throughout the great seat of the paucity of the Archipelago, but chiefly Mindanao, Solo and the crowd of other islands extending from Mindanao to the N E Coast of Borneo, and separating the Mindoro from the Solo Sea

S E Indonesia from the East Coast of Borneo to New Guinea, including the Western Papuan islands and the Keh and Aiu Archipelagos In this division are the N Moluccas, Banda, Ceram, &c S Moluccas, and the Keh and Aiu

S Indonesia, the great southern or trans-Javan chain between Java and New Guinea, or from Bali to the Timor Laut group

Melanesia includes New Guinea, Australia and all the eastern Papua islands

Papuanesia distinguishes the northern islands inhabited chiefly by spual haired tribes from Australia

Micronesia all the islands between Melanesia and the Luchu and Japanese chain

Polynesia, all the islands of the Pacific to the east of Micronesia and Melanesia as far as Easter Island

Malaya-Land includes all districts possessed by the Malay men of Malaya race and language

Java-Land, by those of the Java race, and similarly, Sunda Land, Wugu Land and Battu Land.

Mr Logan regards the Chinese as an agglomeration of several distinct nations, which still retain distinct languages These nations differ very considerably in their physical characters although much mixture has taken place The northern or predominant nation appears to him to have a fundamental tendency to an Arian modification of the Turanian type, and the same tendency is observable amongst the Koreans and the higher classes of the Japanese, as amongst some of the American, Tangutian, and Asiatic peoples In the south of China, the fundamental tendency is to an extreme flatness of features, the nose being often more insignificant and shapeless than in any other race, although the finer type also occurs In the eastern maritime province, the northern type is much more common The dominant or northern Chinese race is much less Mongolian than the S Chinese, the Malay, and most of the intermediate Ultra Indian races They are closely allied to the Japanese and Americans and indeed are evidently the same race however much their language differs

Mr. Logan is of opinion that the Chinese development had a considerable influence in Eastern and Mid-Asia, the Aino-Japanese band, Micronesia, and probably Asiamesia generally It has a strongly marked physical relation not only to all the races of the Mongolian type, but in a much closer or more special manner to the Tibetan tribes, the American Indians and some of the Eastern Asiatic tribes, in all which one of the prevailing Chinese types may be traced Numerous examples of the elongated head, the densely wedge shaped cranium, and arched nose of America and New Zealand may be seen in every assemblage of Chinese in Singapore The occipital humpature remarked in Ameri-

ca and Polynesia, is common in S E Asia. It is very strongly marked in the Lau race. The Tibetan tribes have the use of the skull at the coronal region but the other characteristics are common. The heads of the American men in plates 30, 31, 35, 36, and 37 of Dr Pritchard's *Natural History of man* are Chinese. The prominent lateral expansion of the zygomæ, is common in the Chinese race as in the Americans. The Sumatra Malays have much more frequently the typical Mongolian head as have also the allied tribes of the Irawady basin, with whom they are most nearly connected and whence they have undoubtedly derived their physical stock — *M. Logan in J I A* 1850-58. See India.

MICROPUS See Buds.

MICRORHYNCHUS SARMENTOSUS

A sand binding plant growing on the shores of the Bay of Bengal.

MICROSCOPIC WRITING Layard's latest work on Nineveh shows that the national records of Assyria were written on square bricks, in characters so small as scarcely to be legible without a microscope, in fact, a microscope was found in the ruins of Nimrod — *Curiosities of Science*, p 42.

MIDA, according to Colonel Todd, the three great branches of the Indo or Lunar Aswa races, Pnu-mede, Uja-mede, and Deo-mede had the surname of Mida, pronounced Mede, and he supposes them to be the Aswa invaders of Assyria and Media.

MIDDAY KEERAY Tav Anystasia coromandelini.

MIDDLETON, Sir Henry, an officer in the Maritime Service of the English E I Company, who commanded in their sixth voyage, in 1610.

MIDGE The rein-deer is tormented by two kinds of Gad-fly (*Eristus*), also by the mosquito, which is similar in appearance to the midge or gnat, in wooded and low situations these insects swarm about the creature, literally in clouds.

MID HIMALAYA, a term proposed by Alexander Cunningham to designate a parallel range of the western Himalaya. Another range he designates the Outer or Sub Himalaya and lower down is the Sewalik. See Himalaya.

MIDNAPORE one of the largest and most important districts of Bengal. The town is 69 miles from Calcutta by a good road. The population of the district is estimated at 1,200,000. The existing and projected canals in India are numerous. Midnapore is proposed to be saved from famine by leading in the Selye river, and Bengal is to be protected by a system of

channels from the Gundak river through the districts of Chumparum, Saurin and Tihoot. At a cost of 300,000£, a canal is to connect Calcutta with Raueeganj, a distance of 300 miles, and its coal will be cheaply delivered. The Gauges canal has branches to Cawnpore, Futtehghur and Etawah. A channel is to be led from the Ramgunga. A canal leads from the Sardah river into Oudh. The Bari Doab canal is proposed to be extended by forming a dam across the Sutlej at Hueekee. The western Jumna canal is to be enlarged towards Susee. The Sutlej canal projected in 1861 is to take up the irrigation where the Jumna ceases to provide for it and for this purpose, will supply the tract west of the Markunda irrigation. There are great canals of the Ganges, Jumna and Baree Doab, and anerts on the Godavery, Kistnah, Pennar and Cauvery. The Mann Conwar river in Mysore with the Nundoor Sieramadwara and Mascehully reservoirs. Great canals in Sind, embankments in Bengal and Burmah, a dam across the Kistnah river in the Dekhan, one across the Guna in Kandesh, and a similar dam across the Taptee to provide irrigation for Khundesh. In Sind, is the great Bigaree canal, for the enlargement of which a resolution was come to and it has been proposed that all the inundation channels of that province should be converted into perennial flowing streams. A reservoir has been constructed near Sholapore at a cost of £90,000. Large works have been planned for Guzerat and the Dekhan, and others for the Central Provinces, for works from the Pench river north of Nagpore, and from the Warda river to its south, and the waters of the Betwa river are to be led to irrigate Bundelcund which has been fifteen times desolated by famine in the last three centuries. One third of the water will go to the Patiala State. It will require two millions to irrigate the lands between the Jumna and the Baree doab canals — *Friend of India*. *Annals of Indian Administration*. See India. Kol.

MIETTI, Cing Wax

MIGLIO, It Millet

MIGNONETTE, *Reseda odorata*, is a general favorite in all countries, and may be grown in great luxuriance on the plains during the cold months, does not like to be transplanted, and ought invariably, whether in pots or flower beds, to be sown where intended to flower requires an open soil and free drainage, sometimes lives through the hot season, if sheltered by a high building—*Jafrey*

MIGRATION OF BIRDS, the great migration of birds to and from Southern Asia, says Mr Hodgson, seems to take place across the mountains of Nepal The wading and natatorial birds, generally, make a mere stage of the valley, on their way to and from the vast plains of India and Tibet, the valley being too small, dry, open, and populous for their taste—especially that of the larger ones Some, however, stay, for a longer or shorter time, in their vernal and autumnal migrations and some, again, remain throughout that large portion of the year in which the climate is congenial to their habits Of all of them, the seasons of arrival both from the north and from the south, are marked with precision, and Mr Hodgson was led to conclude from what he observed there, that the mass of the gallatores and swimmers are found in the plains of India, only during the cold months for they all arrive in the valley of Nepal, from the north, towards and at the close of the rains, and all as regularly re-appear from the south upon, or soon after, the cessation of the hot weather In his enumeration of them therefore, he divides the migratory birds into the following three classes—

MIGRATION OF BIRDS

1st—Such as usually pass over the valley, seldom alighting, and only for a few hours

2nd—Such as alight and stay for a few days or, at most, weeks

3rd—Such as seem to seek the valley, not as a caravansary merely, or house of call, for momentary or temporary sojourn on their way to some remote abode—but, as their permanent dwelling place for the entire season

4th—Such as do not appear to migrate at all, notwithstanding that all their nearest kindred (so to speak) do so regularly

The migrations of birds has been the theme of poets and naturalists in all ages Mrs Hemans, asks of the swallows,

Birds, joyous birds of the wandering wing,
 Whence is it ye come with the flowers of spring?
 "We come from the shore of the green old Nile,
 From the land where the roses of Sharon smile,
 From the palms that wave through the Indian sky,
 From the myrrh tree of glowing Aaby
 "We have swept o'er the cities, in song renown'd,
 Silent they lie, with the deserts round!
 We have crossed proud rivers, whose tide hath roll'd,
 All dark with the warrior blood of old,
 And each worn wing hath regained its home,
 Under the peasant's roof-tree, or monarch's dome"
 And what have ye found in the monarch's dome,
 Since last ye traversed the blue sea's foam?
 "We have found a change, we have found a pall,
 And a gloom o'ershadowing the banquet's hall,
 And a mark on the floor, as of life drops spilt,
 Nought looks the same, save the nest we built!"
 Sad is your tale of the beautiful earth,
 Birds that o'ersweep it in power and mirth!
 Yet, through the wastes of the trackless air,
 Ye have a guide, and shall we despair?
 Ye over desert and deep have passed,
 So shall we reach our bright home at last!

Another poet thus alludes to the migration of swallows

"As fables tell, in Indian sage,
 The Hindoostani woods among,
 Could, in his desert hermitage,
 As if t' were marked in written page,
 Translate the wild bird's song
 "I wish I did his power possess,
 That I might learn, fleet bird, from thee,
 What our vain systems only guess,
 And know to what wide wilderness,
 You go across the sea"

The Jackdaw, *Corvus monedula*, of Europe, Siberia, Barbary, W Asia, Peshawar valley, and Kashmir, may be seen in flocks in winter in the northern frontier of the Panjab, associated with the Cornish chough and the rook The first two come from Cashmere, where they are found in great abundance, during the summer, but the rook, if ever seen in Cashmere, is only a cold weather visitor and seems to come from the west, inasmuch as it is said to be common in Afghanistan It appears at Rawul Pindce

in flocks about the beginning of September, it is found in winter as far south as Lahore and disappears entirely in March. The hooded crow has been brought from Northern Afghanistan, and is mentioned by Lieutenant Wood in his travels as common in Kunduz, but it is not found in Cashmere or in the Panjab. The chimney swallow makes its appearance in October and leaves again for the straw built sheds of Cashmere, where it breeds and spends the summer months. The white rumped martin and sand martin are both likewise migratory, and return to Cashmere and Ladakh in summer. The black and alpine swifts remain longer, and may be seen circling about during the summer evenings, especially after a shower of rain. The ring-doves are a resident on the sub-Himalaya. The common starling is plentiful in the north as elsewhere in Hindustan. The lapwing, *Vanellus cristatus* arrives in flocks in the beginning of November, and departs for the west early in spring, its summer residence has not been found out, but it must be common in certain parts of Persia and Afghanistan. The common and jack snipe, with a few painted snipe, appear in the Ravi and Pindie in February and March, and are procured as many as thirty couple at a time.

Nearly all the water fowl met with in the rivers and marshes of the north-west come from the Tartarian lakes, where they may be found breeding.

After a sultry day it is usual to see the wine-tailed swallow skimming over the plains, and by the side of pools and streams a solitary green sandpiper, *Totanus ochropus*, is not rare. The brown backed heron, *Ardeola leucophaea*, also occurs in such situations. The black ibis (*G. pillosus*), with its red crown, is seen during the cold months flying along with the rooks and European jackdaws, and besides, on the marshes about, the great and little bitterns, with the spotted tail, are not uncommon. Of the other European birds may be noticed the short-eared owl, moon buzzard, the pale hunter, *Circus swainsoni*, the cormorant, ibis, and snipe, all coming and departing with the winter months.

Gangsa, Gung Kui, Chaloong, Toong Toong—comprise the numerous wild fowl, of Tibet, swimmers and waders, which migrate from India in March and April, and return in October and November, they are all eaten, but not extensively. There is a prejudice against killing them, but as they all breed on the lakes and rivers of the country and are very numerous, the eggs are found in great quantities, the people who live by gathering and selling these eggs never rob a

nest of all its contents, but take about half the eggs. This forbearance arises from the general aversion to taking life which prevails in Tibet and it has its reward as it is supposed that the birds if entirely deprived of their young, would not again return. The Messrs. Schlagentweit, however, state that there are no migratory birds in the Himalaya, that nowhere and at no season saw they flocks crossing the Himalaya, as many birds of Europe cross the Alps, between Italy and Germany. The Himalayan birds do not change their abodes on a large scale, the various different heights themselves afford them the opportunity to select the climate they require in different seasons. In the plains of India, however, chiefly in Bengal, a large number of birds disappear during the breeding time, they do not, however, leave India altogether but select their abodes in the lower, impenetrable jungles of the delta of the Ganges and Brahmapootia, called the Sunderbans, where they were found by Hermann Schlagentweit in large quantities, whilst at the same time they had entirely disappeared in Bengal proper—*Hodgson, Esq., in the 18th Volume of the Asiatic Researches, Part II, 122 Adams*.

MIGRATION OF RACES Besides the familiar instances of the Samaritans and Jews transplanted under the Assyrians, Persian history repeatedly shows the deportation of whole tribes, expressly termed *ανασταστοι* by Herodotus. The Pæonians were removed to Phrygia, the Bæcarians from Africa to Bœtia, the Milesians to Ampe, near the Tigris, Egyptians to Susa, Etruscans from Eubœa to Ardenicea and to Gordœyn, and of Antiochians to Mahuza. Herodotus, and Strabo quoted. In the winter of 1563-4 when the Circassians, finally overcome, resolved to quit their country, they moved in great bodies into the Turkish dominions, and it was supposed that above 300,000 would so arrive. Perhaps the numbers in the migration of the Celtic Irish west-wards to America exceeds all known instances. The migratory tribes of India, Bhaurah, Sansi, Harn, Kunjar, Dhanuk, have ostensibly humble avocations, but are great robbers. It would be of value to know whether any of them are settling down to town life, as many of the gipsies in Britain have done—*Elliot's Hist of India Campbell 126*.

MIKADO or spiritual emperor of Japan, also called Danu or Danisama. The Mikado is head of the religion of the country, and the Tycun, Zeogun, or Kobo, the chief of the State, who holds his court at Jeddo. About B. C. 600 Japan was ruled by Zin-mu-tin-wu, or the divine conqueror, who was a Chinese warrior and conqueror and the founder of the Mikado dynasty, which about the 16th century became set aside from temporal affairs. See Kobo, Japan, India.

MI-KHYOUNG, See India

MIKIR, a mountain race, to the south of the valley of Assam in lat $26^{\circ} 20' N$, and between lon 93° and 94° East. They are to the north-west of the Naga tribes and N. E. of the Kuki. The Miku tribe are partly hillmen and partly lowlanders, occupying a considerable area in the Assam district of Nowgong and in Northern Cachar. Their numbers are computed at 26,000. The Miku inhabit the lower part of the Khassiah and Jynteah hills. They flit from place to place every four or five years to cultivate cotton and rice. They build houses on platforms, drink spirits, eat opium and are either unbelievers or imperfect converts to hinduism. They delight in festivals and in their attendant drunkenness, they eat beef and pork, and fowls are sacrificed to the sun, moon, and invisible deities attached to trees; their physiognomy and dress is that of the people of the Khassya Hills, to whom the Miku seems to be allied, and perhaps the Naga, the Garo, the Khassya, Jaintia and Miku are all allied. The Miku of North Cachar are mild and little courageous though they carry the dhao and spear. The tract of country situated in the Nowgong district, called the Miku Hills, extends from the Kuleance river east to the Joommoonah river west of Dubboka, about sixty miles in length, or seven day's journey. On the north, the Miku hills are bounded by the plains of the Miku-pai Mahal, the Mongahs of Rungobegui, Kageerunga, and Bokakhat. From north to south, to the Joommoonah river, the distance in a straight line may be thirty-five or forty miles. The Miku villages and cultivation extend eastward only as far as the Kuleance river in Morung. Beyond that river the Rengmah boundary commences, and terminates with the Dhunseerac river, separating Nowgong from the Sebsagar district. The Miku generally inhabit the interior portion of the hills, but a majority of these villages are within a day's journey of the plains. According to the tradition of the tribes, they were

MIKIR

originally settled in Tooleciam Senaputtee's territory. As the Miku take up fresh land every two or three years, and remove their dwellings to different parts of the hills, it is necessary to make a new settlement every year with their chiefs. No correct census of the Miku population to this day has been taken, but from the revenue statement given in by the Miku chiefs for the year 1851-52 there are, in the Miku hills 1,494 houses in Northern Cachar, 356 houses so that the population for the whole tribe in the Miku hills and Northern Cachar, may amount to about 9,250 persons. The houses vary in size according to the number of families residing under one roof. Some are thirty, some forty feet long, and twenty feet wide, with the grass roof brought down almost to the platform. The whole building consists of one large room, they keep their grain in baskets in the room, and men, women, and children, all lie down together on their respective mats in their allotted places, they wear a small piece of cotton cloth round the waist, which extends nearly to the knees, and the women in their villages do not cover the breast. They are, chaste, and in morals superior to the people of the plains. They are said to worship the sun and moon, and make sacrifices to both, of hogs, goats, and fowls but these sacrifices may be considered more in the light of feasts, as the portion allotted to the deity is very scanty and composed of the refuse parts. They also sacrifice to rivers, and large stones, or trees, in their neighbourhood, which are considered the abode of the deities. On the appearance of any epidemic amongst them, they have recourse to sacrifices. Unlike most hill tribes the Miku seem devoid of anything approaching to a martial spirit. They are a quiet industrious race of cultivators, and the only weapons used by them are the spear and dao hand bill, for cutting down jungle.

The Naga, Miku, Kachari, Garo and Khassia are the five races, in whose possession chiefly are the broad highlands of the Asam chain extending from the N. E., near the head of the Kynduayn and Namiup, on one side, along the valley of the Biahmaputia to its southern bend round the western extremity of the chain, and on the other side, south westerly, along the valley of the Burak and Suima. These highlands are thus embraced by the valleys of the Biahmaputia and its affluents on all sides but the S. E., where they slope to the Kynduayn. The Naga dialects are

On the west, the Naga march and intermix with the Rang-tsu, a branch of the Kachari or Bodo

The Khasia is distinguished from all the surrounding languages, Indian, Ultra-Indian, or Tibetan. It is a fragment of the Mon-Kimbojan formation of languages, and is a remnant of an older formation which preceded the Burma-Tibetan in Northern Ultra-India

The valley of Assam and its bordering hills are remarkable for the number of populations which they contain. Amongst these are the Bodo or Boro of Assam and Cachar, Gajo, Kisa, Miku, Aka, Dola, Aboi, Mui, Boi, Aboi, Mishnu, Muttuk, Singhpoo, Jih, Naga, Changlo, Bhot, and Kuki. On the south it is bounded by the Guro, Kasia and Jaintia hills, then the lands of the Naga in north Cachar and Naogong then those of the Singhpoo up to the great bend of the Brahmaputra. All these native populations are more or less akin to the peoples of the Burmese empire. On the Southern Assam frontier we have the numerous Naga and Singhpoo dialects, the Miku and Angami, the languages of the Khasia and Jaintia hill-men, the Boro in Cachar, and the Gajo in the hills of that name. The Kuki occupy parts of Tipperah and Chittagong and the Mug race are in Arakan and Chittagong.—*Latham's Descriptive Ethnology, Butler's Tracks and Adventures in Assam*, pp 126 to 135 *Ann Ind Adm Vol XII* p 63 See Joboka, Kuki, Khasiya, Naga

Servia	2,500	985,000	891,400
Switzerland	—	—	—

The cost of the British soldier in comparison with the soldier of other countries is largest. After England comes France with her conscription, paying little more than half the sum paid by Great Britain. Italy is next on the list, and then Spain. All the other States pay less than 40£ per man. Sweden it will be seen, has more soldiers in comparison to the number of inhabitants than any other country—1 in 56. Holland comes next, with 1 out of 60. Between France and England a considerable difference exists, France taking 1 out of 73 inhabitants, England but 1 out of 97.

Solid matter	12 98	8 31	13 00	13 20	14 38

The Chinese make no use of milk, either crude, nor in the shape of curds, butter, or cheese the young animals are allowed the whole produce of their mothers, the Chinese have no repugnance at killing of cows, nor indeed to killing and eating anything else Milk of cows, goats, &c, is little used as an article of diet in Southern Asia It may even be said that aversion to milk as an article of food obtains among nearly all the Chinese, Indo-Chinese and Malay races, including specifically the Khasia of the Eastern frontier of British India, the Gair and Naga, the Burmese, the Sumatran races and the Javanese, and Sir John Bowring in a letter published in the Journal of the Statistical Society, mentions that the same aversion prevails in China The Bia-hu and Belochi nomades in the Peshin valley, though they will give milk in exchange for other commodities, yet they consider it a disgrace to make money by it With the Arabs the term "labban" (milk-seller) is an opprobrium and a disgrace They will give on exchange, but not sell milk Possibly the origin of the prejudice might be the recognising of a traveller's guest-right to call for milk gratis No one will sell milk even at Meccah, except Egyptians, a people supposed to be utterly without honour As a general rule in the Hejaz, milk abounds in the spring, but at all other times of the year it is difficult to be procured — O'Shaughnessy p 690 Moor, p 140 Yule's Mission, p 2 Burton's Pilgrimage to Meccah, Vol 1 p 362-63 Wall, 42 See Abishegam

MILK OF PALM NUTS Is a popular term, for the albumen of the seed when in a liquid state and which, when the fruit is

MILLET

quite ripe, appears as a solid white or yellowish mass, and is then termed the kernel This albuminous fluid or water when the nut is taken from the tree early in the morning and whilst the dew is still upon it, is a cool and delicious draught It is slightly effervescent and gently appetent See man

The millets belong to the natural order Paniceæ,—the Gramineæ of Lindley, the grass tribe and the species chiefly used as food for man are as under

<i>Paspalum stoloniscum</i>	<i>Pennisetum brabatum</i>
<i>Panicum miliaceum</i>	<i>Sorghum vulgare</i>
" <i>miliace</i>	" <i>saccharatum</i>
" <i>italicum</i>	" <i>glaucum</i>
<i>Oplismenus frumentaceus</i>	" <i>bicolor</i>
<i>Zizania</i>	" <i>cernuum</i>
<i>Oryza sativa</i>	<i>Eleusine coracana</i>
<i>Triticum vulgare</i> (ca.)	" <i>stricta</i>
<i>restivum</i> and <i>hybernium</i>)	<i>Hordium vulgare</i>
<i>Secale cereale</i>	" <i>hexastichon</i>
<i>Pennisetum spicatum</i>	" <i>distichon</i>

Millets of various kinds are met with in the hottest parts of Africa, in the South of Europe, in Asia Minor and in the East Indies. In India they hold a rank second to rice alone, and those chiefly cultivated are as follows,

Botanical Names	English	Hindoostanee	Tamil
<i>Setaria italica</i>	Italian millet	Kala kangnee	Tenny
<i>Setaria germanica</i>	German millet	Kora kang	Var: 500
<i>Panicum miliaceum</i>	Common or little millet	{ S. m. c., cheena } { Warree }	
<i>Pennisetum spicatum</i>	Spiked millet	Bayree	Cumbho
<i>Sorghum vulgare</i>	Great millet	Jowaree	Cholum
<i>Sorghum saccharatum</i>			
<i>Eleusine coracana</i>	Raggy	Nitchmee Raggy	Kavaroo

The native West Indian species are *P. fasciculatum* and *P. oryzoides*. *Setaria germanica* is the most common in America, where millet is chiefly grown for making hay, half a bushel of seed to the acre is the usual quantity, sown broad-cast and harrowed in, but to procure the finest quality of hay, an additional three or four quarts of seed is sown. The ordinary yield of crops is about a ton to a ton and half of hay to the acre, but it should be cut as soon as it is out of blossom, for if it stand later, the stems are liable to become too hard to make good hay. In Southern India, there are three kinds of Jowaree, white, green, and red, the straw is of great bulk and goodness, and furnishes good provender for cattle, being preferable to that of rice. It is however given dried, as the green plant is injurious. Among culmiferous plants and legumes used in the East, are the *Panicum italicum*, *Eleusine coracana* (the meal of which is baked and eaten in Ceylon under the name of Cokkan flour), and *Paspalum* of several varieties. The pigeon pea (*Cytisus cajan*) is cultivated throughout India, and a very valuable and prolific species of bean, called the Mauritius black bean (*Mucuna utilis*), growing even in the forest soil,

is cultivated in India and Ceylon. *Sorghum vulgare* is the principal grain of Southern Arabia and the stems are also used extensively for feeding cattle. The plant bears the Hindi name of joari, or jwari, and is cultivated throughout Western Hindoostan, and in most parts of the western Dekhan, between the Nerbudda and the Godavery. In China, the *Setaria italica*, the *S. glauca*, the *Panicum miliaceum*, *Sorghum vulgare* and *Sorghum saccharatum* are all cultivated. Millets are known to Europe as petit maïs, or tropical crops. In India, they form a great part of the food of the people everywhere but on the sea board, in the valleys and on the banks of rivers, perhaps as much as rice and more than wheat, and in Egypt perhaps, surpass all other crops in importance. In Western Africa they are the staff of life. The red and white millets shown by Austria, Russia and the United States, at the Great Exhibition of 1851 were beautiful, and Ceylon exhibited fine samples. Turkey abounds in small grains. *Panicum miliaceum*, *P. frumentaceum* and *glaucum* are all grown in the East Indies and China. London says there are three distinct species of millet, the Polish, the common or German, and the Indian. *Setaria germanica* yields German millet. The plants are readily increased by division of the roots or by seed, and will grow in any common soil. The native West Indian species are *P. fasciculatum* and *P. oryzoides*.

In the United States, the *Setaria germanica* millet is chiefly grown for making hay, being found a good substitute for clover and the ordinary grasses. The plant flourishes well on rather thin soils, and it grows so fast that when it is up and well set it is seldom much affected by drought. It is commonly sown there in June, but the time of sowing will vary with the latitude. Half a bushel of seed to the acre is the usual quantity sown, broad-cast and harrowed in. For the finest quality of hay, it is thought advisable to sow an additional quantity of three or four quarts of seed. The ordinary yield of crops may be put at from a ton to a ton and a half of hay to the acre. It should be cut as soon as it is out of blossom, if it stand later, the stems are liable to become too hard to make good hay. It grows ordinarily to the height of about three feet, with compact heads from six to nine inches in length, bearing yellow seed. The sub-varieties of this, are the white and purple-seeded. The Italian millet, *Setaria italica*, is larger than German millet, reaching the height of four feet in tolerable soil, and its leaves are correspondingly

larger and thicker. The heads are sometimes a foot or more in length, and are less compact than the German, being composed of several spikes slightly branching from the main stem. It derives its specific name from being cultivated in Italy, though its native habitat is India. It is claimed by some that this variety will yield more seed than any other, and the seed is rather larger, but the stalk is coarser, and would probably be less relished by stock. If the greatest amount of seed is desired from the crop, it is best to sow it in drills, two to two-and-a-half feet apart, using a seed drill for the purpose. This admits of the use of a small harrow or cultivator between the rows, while the plants are small, which keeps out the weeds. The crop will ripen more uniformly in this way than broadcast, and enables the cultivator to cut it when there will be the least waste. The seed shatters out very easily when it is ripe, and when the crop ripens unequally it cannot be cut without loss because either a portion of it will be immature, or, if left till it is all ripe, the seed of the earliest falls out. It should be closely watched and cut in just about the same stage that it is proper to cut wheat, while the grain may be crushed between the fingers. It may be cut with a grain cradle, and, when dry, bound and shocked like grain, but it should be threshed out as soon as practicable, on account of its being usually much attacked by birds, many kinds of which are very fond of the seed. The seed is used in various European countries as a substitute for sago, for which it is considered excellent. It is likewise a valuable food for poultry, particularly for young chickens, which from the smallness of the grain can eat it readily, and it appears to be wholesome for them. In some countries millet seed is ground into flour and converted into bread, but this is brown and heavy. It is, however, useful in other respects—as a substitute for rice. A good vinegar has been made from it by fermentation, and on distillation, it yields a strong spirit. The sugar millet seed—the produce of *Sorghum saccharatum*—is used chiefly for puddings, by many persons it is preferred to rice. It is cultivated largely in China and Cochinchina. The stalks, if subjected to the same process that is adopted with the sugar-cane, yield a sweet juice, from which an excellent kind of sugar may be made. Millet will grow best on light, dry soils. The ground being first well prepared, half a bushel of seed to the acre is ploughed in at the commencement of the rains in India. The crop ripens within three months from the time of sowing. The usual produce is about 16

bushels to the acre. The Canary Islands export annually about 212,400 bushels of millet.

Sorghum vulgare, Great Indian Millet, Juari, Cholum or Guinea Corn,—is a native of India. It is the *Sorghum vulgare*, the *Andropogon sorghum* of Roxburgh, and produces a grain a little larger than mustard or millet seed. It is grown in most tropical countries, and has peculiar local names. In the West Indies, where it is chiefly raised for feeding poultry, it is called Guinea corn. In Egypt it is known as Dhurma, in Hindostan and Bengal as Joar or Juari, in the Tanul country as Cholum and in some districts as Cush. In Lower Sind joar is very extensively cultivated, as well as bajree (*Holcus spicatus*). It is harvested in December and January, requires a light soil, and is usually grown in the east, after *Cynurus coracanus*. Of the three kinds, known as white, green, and red, juari, the red ripens a month earlier than the rest, or about four months from the time of sowing at the close of May or early in June. A gallon and a third of seed is sown per acre, and the produce averages 16 bushels. This grain, though small, and the size of its head diminutive, compensates for this deficiency by the great bulk and goodness of its straw, which grows usually to the height of 8 or 10 feet. It is sometimes sown for fodder in the beginning of April, and is ready to cut in July. It is said to be injurious to cattle, if eaten as green provender, the straw is therefore first dried, and is then preferable to that of rice. This grain is frequently fermented to form the basis, in combination with goo or half made sugar, of the common arrack of the natives, and in the hills is fermented into a kind of beer or sweet wort, drank warm.

Holcus spicatus, the *Panicum spicatum* of Roxburgh, is cultivated throughout India. From one to four seeds are sown on a biggah of land, and the yield is about four maunds per acre. It is sown after the heavy rains commence, and the plough serves to cover the seed. The crop is ripe in three months, and the ears only are taken off at first. Afterwards the straw is cut down close to the surface of the soil, to be used for thatching, for it is not much in request as fodder. Being a grain of small price, it is a common food of the poorer class of natives, and really yields a sweet palatable flour. It is also excellent as a fattening grain for poultry. The *Poa Abyssinica* is one of the bread corns of Abyssinia. The bread made from it is called teff, and is the ordinary food of the country, that made from wheat being only

MILLINGTONIA

used by the richer classes. The way of manufacturing it is by allowing the dough to become sour, when, generating carbonic acid gas, this serves instead of yeast. It is then baked in circular cakes, which are white, spongy, and of a hot acid taste, but easy of digestion. This bread, carefully toasted, and left in water for three or four days, furnishes the boza, or common beer of the country, similar to the quas of Russia.

Sorghum vulgare and *Penicillaria spicata*, constitute the chief food grains of a considerable proportion of the people of India. Taking British India as a whole, it is only the rich or well to do classes who can afford to employ rice and wheat. The following show the composition, in 100 parts of the white and red *Sorghum vulgare*.

—*Catalogue Exhibition of 1862* *Simmond's Commercial Products* *Smith's, Chinese Materia Medica*, *Roxburgh's Flora Indica*, *Voght, Hortus Suburbanus Calcuttensis*, *Madras Exhibition Juries Reports*.

MILLINGTONIA, Dr Roxburgh restored this name to the system by assigning it to two timber trees, which at that time, as he expresses himself (*Fl Ind* 1 p 102), constituted this strongly marked family, of which

MILLINGTONIA HORTENSIS

one species *M. simplifolia*, was figured in t 254 of his *Coromandel plants*, and with it, another species described in the *Flora Indica*. In 1824, Dr. Wallich sent to England what he considered three more species, *M. dillenifolia*, *pungens*, and *integrifolia*, of these the two last appear to be identical, for no great reliance can be placed on the entireness of the leaves, as some with entire and spinulose margins may occasionally be seen on the same specimen. *M. pinnata* was procured from Silhet, *M. simplifolia* and *pungens* from that district, and the entrance into Nepal, the two last were also found by Dr. Wight, the first on the Nilgheeries, and the second on the mountains of Madura, *M. dillenifolia* Dr Wallich obtained from Chundiaghery, and other elevated mountains in Nepal. The trees Dr. Royle met with belong to Dr. Wallich's two species *M. dillenifolia* and *pungens*, the former found about Dhunaultice and Simla, between 6,000 and 7,000 feet of elevation, and *M. pungens* is common about the rivers below both the Mussooree and Suen ranges. To this is allied another tree found in the valley about Mugia, which Dr. Royle called *M. acuminata*, but it may only be a variety of *M. pungens*. This genus, therefore, consisting of four or five species, is spread over a considerable extent of territory from 10 to 31½° northern latitude, or from the Nilgheeries and Madura, along Silhet and the foot of Nepal to Mussooree and Simla, and has been formed into an order, and an excellent account given by Messrs. Wight and Arnott in Jameson's Journal for July 1833, p 178, at which time they state (*Prod Fl Indæ Penins* p 115) they had not seen the similar remarks made by Jack (*Mal Misc*, 2. p 32). The authors observe, that the habit of the species of *Millingtonia* is much that of *Semecarpus*, *Mangifera* and *Buchanania*, it may be added, that in inflorescence they also resemble the mango. A species of this genus called *Ramondelle*, by the Singhalese, grows in the western province of Ceylon, the wood of which weighs lbs 48 to the cubic foot, and is estimated to last 20 years. It is used in common house buildings. The sticks make excellent fences — *Royle Ill. Him. Bot* p 139 *Mr Mendis*.

MILLINGTONIA HORTENSIS, Linn fil.

Bignonia suberosa, Roxb.

This grows throughout India and Ceylon, it is an elegant tree growing to the height of fifty feet, is in blossom towards the close of the rains, and the seeds ripen in March. The bark is of a soft spongy nature, the wood is white, firm, and close grained — *Thw, Dr. Riddell, Enum pl Zeyl*, p 206.

MILLINGTONIA SIMPLICIFOLIA, *Roxb*

This tree grows in Madura, Nepal, the Khas-ya hills, and is found in the forests of the Pegu valley, but scarce. Its properties as a timber are valuable from its weight and strength. Wood white colour and adapted for every purpose of house building—*Royle Vort, Hort Suburb Calcut.*

MILUM A glacier in the Himalaya, 8 to 10 miles in length and 3,000 feet broad

MILVUS The relentless persecution by gamekeepers has now very nearly extirpated, as a permanent inhabitant of Britain, that fine handsome bird, the common European kite (*Milvus regalis*), it was numerous in England in the days of the Tudors. The Scavenger Kites of India (*M. Govinda*) remind the British exile in this country of his distant home in the west. Hamilton Buchanan remarks that, when gorged, this bird delights to sit on the entablature of buildings, exposing its back to the hottest rays of the sun, placing its breast exactly as the Egyptian Hawk is represented on the monuments—*Sir James Emerson, Tennent's Sketches of the Natural History of Ceylon*, p 246.

MIMANSA, in hinduism, a school of philosophy, which investigates the doctrine and practices of the Vedas. The Hindus boast of six different schools or systems of metaphysical philosophy. They are called the Purva Mimansa, Uttara Mimansa or Vedanta, the Saukhyia, the Patanjala the Nyayika, and the Vaisheshika, these, although some of them offer irreconcilable contradictions to essential doctrines of their religious belief, are recognised by the brahmans as orthodox, and attributed to authors of saintly reputation. There are other schools, as those of the Chaivaka, Buddhist, and Jain, which, although in some respects not more at variance with received opinions than the

preceding, are stigmatized with the reproach of infidelity and atheism. The cause of this difference is sufficiently obvious, and is characteristic of a state of feeling which prevails as much in the present as in any former period. The orthodox schools of philosophy do not disparage the authority of the Vedas, they do not dissuade the celebration of the acts of formal devotion which the Vedas or Puranas enjoin, although they argue their utter inefficacy as means of final and permanent felicity. They recommend their performance, however, as conducive to that frame of mind in which abstract contemplation may be safely substituted for devotional rites, and even admit of external observances after the mind is in pursuit of true knowledge, as long as such ceremonies are practised from no interested motive, as long as they are observed because they are enjoined, and not because any benefit is either to be expected or desired from their practice. Again, the writings of the orthodox philosophers meddle not with existing institutions, and least of all do they urge or insinuate any consideration to detract from the veneration, or trespass upon the privileges, of the brahmans. As long as these precautions were observed, the brahmans did not, nor would they now object, to any form of doctrine having in view the establishment of merely abstract propositions. The case was very different with the heterodox schools, They went from abstractions to things. The Chaivaka condemned all ceremonial rites, ridiculed even the shaddha, and called the authors of the Vedas, fools, knaves, and buffoons. The Buddhists and Jains denied the inspiration of the Vedas and the sanctity of the brahmanical character, abrogated the distinction of caste, invented a set of deities for themselves whom they placed above those of the hindu pantheon, and organized a regular hierarchy, a priesthood, and a pontiff, an institution still subsisting in the trans-Indian countries, of which the grand Lama of Tibet is the head. It is a remarkable historical fact, that this organization was found too feeble to oppose, in India, the apparently loose and incoherent, the undisciplined, the anarchical authority of the brahmans. It had, however, the effect of exciting their apprehensions and then hatred to such an extent that it became proverbial with them to say, "If you only alternative be to encounter a heretic or a tiger, throw yourself before the latter, better be devoured by the animal than contaminated by the man." There may be a few of the Chaivaka sect in India, but their opinions are unavowed. The Buddhists have numbers and

influence in the west of India, but are little heard of elsewhere, in India though numerous in Ceylon, Tibet, Burmah, Siam, Cambodia Cxhen China, China and Japan

Besides the above acknowledged schools or systems of philosophy, there is the *Pauiarik* or system of the *Puianas*. It is not considered one of the number of regular schools, and does not claim the character of a system, but it presents a peculiar scheme of doctrine on metaphysical subjects and exercises more influence over popular opinion than any of the rest. It may also be termed the eclectic school as it has evidently derived its principles from different systems and formed them into a miscellaneous combination of its own contrivance. It is not put forward as a new scheme, but is subsidiary to the popularization of particular objects of worship for which the *Puianas* seem to have been composed. The *Vedas* are authority for the existence of a Divine Being, supreme over the universe and existing before all worlds. "In the beginning," it is said, "this all (this universe) was in darkness. He (the supreme) was alone without a second. He reflected I am one, I will become many." Will was conceived in divine mind and creation ensued. This being the doctrine of the *Vedas*, is also that of the *Vedantas*, the purport of which school is declared to be the same as that of the *Vedas*, their end (*anta*) or aim. The *Vedanta* is called also the *Uttara-mimāṃsā*—subsequent or supplementary investigation. There is also, however, a *Puiva-mimāṃsā*, or prior school of investigation, the object of which is to teach the art of reasoning, with the express purpose of aiding the interpretation of the *Vedas* not only in the speculative but the practical portion. As far as concerns the former, it of course adopts the same monotheistic principles. The *Patanjala* school teaches also the being of a God, the *Nyayika* and *Vaisheshika* teach the existence of one Supreme Soul—the seat of knowledge and the maker of all things, and the *Pauiarik* or Eclectic school maintain the same doctrine. The *Sankhya* denies the existence of a Supreme Being, although it recognizes a two-fold distribution of the universe as matter and spirit. Of these six ancient schools of philosophy recognised among the hindus, some are avowedly inconsistent with the religious doctrines of the brahmans, and others, though deemed perfectly orthodox, advance opinions not stated in the *Vedas*. The six schools are enumerated in the following order by Mr Colebrooke

The prior *Mimāṃsā*, founded by Jāmani
The latter *Mimāṃsā*, or *Vedanta*, attribut-

ed to Vyasa

The *Nyaya*, or logical school of Gôtama.

The Atomic School of Canāde

The Atheistical School of Kapila

The Theistical School of Patanjali

The two last schools agree in many points and are included in the common name of *Sankya*—*Wilson's Religious Practices and Opinions of the Hindus*, p 44. *Elphinstone's History of India*, p 215. See Brahman, Daisana, Hindoo, Nyaya, Vidya

Rhamnus purpureus

MIMBAR HIND A mahomedan pulpit also the minarets of a mosque

MIMOSA, a genus of plants of the natural order Fabaceæ, or Leguminosæ, of which the following species occur in the South and East of Asia

Asperata,	Mutabilis,	Rubicaulis,
Hamata,	Pudica,	Sensitiva,

The leaves of some of the species are remarkable for being sensitive to the touch. The pink and yellow flowers of one of the small shrubby kinds are particularly beautiful in the rains, they readily grow from seed in any soil. The Wattle-bark of commerce is procured from different species of mimosa, which grow in Australia and New Zealand. It is sometimes imported in the form of fluid extract, as well as bark. The leather produced by its means is of good quality, but of bad colour. The bark must be finely ground, or it does not give up the whole of its tannin to warm water. Many plants formerly placed by botanists in this genus have been referred to other genera.

This plant has a long, flat pod or legume, containing separate, small, oval, dark coloured seeds, and is considered by Native Practitioners a most valuable medicine. In taste it somewhat resembles the soap nut, but is more acid, less bitter, and has a singular pungency. Its qualities are said to be deobstuent, detergent and expectorant. It is commonly prescribed in cases of jaundice and other biliary derangements, and is, besides, used by them like the soap nut, for washing the head. The small leaves of this prickly shrub have a pleasant acidity, and are frequently put into pepper water, when it is found necessary to keep the

The Flower

Mulsai ka phool,	HIND	Maghadam poo,	TAM
Bacula,	SANS	Poghada	TEL
Bolsai ka phool,	DUK		

This ornamental flowering tree grows in Ceylon, throughout the peninsula and the north of India, in Burmah, Pegu, Tenasserim and the Moluccas. In the Bombay forests, it is mostly found as a cultivated tree, more rarely wild and then only below the ghats. It has dark evergreen oblong alternate leaves, and small pale brown or white sweet smelling fragrant flowers, of moderate size, from which an oil is distilled. Its flowers are celebrated in the Puranas and even placed amongst the flowers of the hindoo paradise. Krishna is said to have fascinated the milkmaids of Bundabun, on the banks of the Jumna, by playing on his flute beneath a bakula tree, the wood is strong, very hard and durable, for any ordinary purpose, serviceable for houses, but not used in ships or boats. The berries are eaten sometimes by the poor Burmese ladies, value its small delicate sweet-scented blossoms, which they string in chaplets for the head. A cubic foot weighs lbs 61 and it is estimated to last 50 years — *Dis Rorb Wight, Gibson, J L Stewart, Mason, Voigt, Cal Cat Ex 1862, Madras Er Jui Reports, Mr R Brown, Thwaites, Ains Mat Med p 158 Gen Med Top p 190, Mr Mendis, Mr Rohde*

The Fruit

Keerm ka phal	DUK	Palay pallam	TAM
Cheenne	SANS	Pala pundoo	TEL

This large, handsome tree grows in the eastern province of Ceylon, in the Deccan, is generally planted by mahomedans, grows near the Godavery, is common in Guzerat, where it reaches a great size, but is seldom found in other of the Bombay forests. The wood is hard, fine grained, rather strong, and much used for sugar mill beams and well-frames in Guzerat, and where strength and toughness are required. A cubic foot weighs lbs 60 and it is said to last 10 to 70 years. It is used for rulers, knobs, handles of tools, such as chisels, &c, and other articles of turnery, and, in Ceylon, for oil presses, bridges and buildings. The small berries are eaten when ripe, are nutritious and palatable. The dried fruit is also occasionally seen. *Dis Rorb Voigt Mason, Ainslie, p 229, Riddell Irvine, and Gibson, M E J R, Mr Mendis Captain Beddome*

------------	-------	--------------	-----

This valuable tree grows very abundantly in the hot, drier parts of the island of Ceylon. The timber is extremely hard, and strong, and very durable. It grows in Trinacelly, but its felling is now, there, restricted as it is in large demand by the Madras Ordnance Department for gun stocks. Until recently the tree was extensively cut for private purposes. *Thw En Pl Zeyl III p 175, Report Conservator of Forests, 1859—60*

The Root

Khirmi Lod'h PANJ

This middle sized tree grows in Malabar, in Northern India, the Panjab, the Malay islands, the Moluccas and New Holland. At Ajmeer and Kotah, the tree becomes very large and handsome. In the Deccan, also, it grows to a large size, and is generally planted in groves. The wood is fine-grained and hard. The fruit, is about the size of a small olive, is of a yellow color when ripe, after the rains, and contains a sweet clammy juice, eaten chiefly by the natives. The flowers are aromatic and the seeds yield medicinal oil obtainable in tolerably large quantities in some parts of the country. In Burmah, this dried fruit is occasionally seen among the Chinese, brought from Singapore. In the Panjab, the powdered seed is applied in ophthalmia, and the root is officinal in Australia, its north-east coast is well wooded, chiefly with the Mimusops kauki, trees of which are, there, often 60 feet high and 3 in diameter — *Voigt, Dr Irvine's Med Top of Ajmeer, p 190, Dis Riddell, Mason and J L Stewart, Macgillivray's Voyage, Vol I p 106*

MINAGARA an ancient city on the Indus river, the chief site of the dominions of the Parthian kings of the Panjab. Its position has occupied the attention of geographers from D'Anville to Pottinger. Sindh being conquered by Omar, general of the (Abbasi) caliph Al-Mansoor the name of Minagara was changed to Mansoorah and the village celebre sur le rivage droit du Sind ou

McNian, "Ptolemee fait aussi mention de cette ville, mais en la deplacant," &c., D'Anville places it about 26° , but not so high as Ulug Beg, whose tables make it $26^{\circ} 40'$. General Cunningham has little doubt that Minagara, handed down to us by the author of the Periplus, was the Saminagara of the yadu Jhaleja, whose chronicles claim Sewisthan as their ancient possession, and in all probability was the strong-hold (nagara) of Sambus, the opponent of Alexander. On every consideration, he is inclined to place it on the site of Sehwan. Vincent, in his translation of the Periplus, enters fully and with great judgment upon this point, citing every authority, Arrian, Ptolemy, Al-Biruni, Edrisi, D'Anville, and De la Roche. He has a note (26 p 336, Vol I) which is conclusive, could he have applied it. 'Al-Birun [equi distant] between Debel and Mansura D'Anville also says "de Mansora a la ville nommee Bunn, la distance est indiquee de quinze parasanges dans Abulveda," who fixes it, on the authority of Abu-Rehan (surnamed Al-Biruni from his birth-place), at $26^{\circ} 40'$. Gayni, or Gajni, is one of the ancient names of Cambay (the port of Balabhipooria,) the ruins of which are about three miles from the modern city. Other sources indicate that these princes held possessions in the southern continent of India, as well as in the Samashtra peninsula. Filatipoor Putun, on the Godavery, is mentioned, which tradition asserts to be the city of Deogn, but which, after many years' research, General Cunningham discovered in Samashtra, it being one of the ancient names of Kundala. In after times, when succeeding dynasties held the title of Bhalaerae though the capital was removed inland to Anhulwaria Putun, they still held possession of the western shore, and Cambay continued the chief port. These invaders were Scythic, and in all probability a colony from the Parthian kingdom, which was established in sovereignty on the Indus in the second century, having their capital at Saminagara, where the ancient Yadu ruled for ages, the Minagara of Arrian, and the Manku of the Arabian geographers. It was by this route, through the eastern portion of the valley of the Indus, that the various hordes of Getae or Jit, Hun, Caman, Catt, Macwahana, Balla and Aswaria, had peopled this peninsula, leaving traces still visible. The period is also remarkable, when these and other Scythic hordes were simultaneously abandoning higher Asia for the cold regions of Europe and the warm plains of Hindusthan. From the first to the sixth century of the Christian era, various

records exist of these invasions from the north. Gibbon, quoting De Guignes, mentions one in the second century, which fixed permanently in the Samashtra peninsula, and the latter from original authorities, describes another of the Getae or Jit, styled by the Chinese Yu-ehi, in the North of India. But the authority directly in point is that of Cosmas, surnamed Indopleustes, who was in India during the reign of Justinian, and that of the first monarch of the Chinese dynasty of Leam. Cosmas had visited Callian, in the Balhara kingdom, and he mentions the Abtelites, or White Hun, under their king Golas, as being established on the Indus at the very period of the invasion of Balabhipooria. General Cunningham identifies Minagara with modern Thatta—*Ted's Rajasthan Vol I p 217*.

MINAH, also written Meena and Mina, one of the ancient races occupying India. Many of these ancient tribes are addicted to robbery, dacoity and thuggee. Amongst others may be named the Bedowiah, a robber tribe, of the north west of India. The Beriah and Minah, robber tribes in Central India, the Mhang, a robber tribe in western India. The Wuddai, a robber tribe on the northern frontier of Canara. The Takinkar, a robber tribe in the Dekhan. The Pardhi, Bhowia a robber tribe of Khandesh and Berai. The Wusaweh a robber tribe of Guzerat. The Bhar a robber tribe of the Bombay presidency. And the Gehai, a large class of child stealers in the valley of the Nerbuddah. See Meena.

MINAHASSA. Menado and Kama in the province of Minahassa lie directly opposite each other on the West and East sides of the North Eastern peninsula of the large and rich island of Celebes, and are open to foreign trade. Menado, the capital of Minahassa is situated on a large and beautiful bay on the west side of the northerly promontory of Celebes, in $1^{\circ} 30'$ N Lat and $124^{\circ} 56'$ East Long Greenwich, according to the chronometers of the *haque Sumatra*, (Dec 1843), according to Horsburgh in $124^{\circ} 52'$ East Long and according to Noire $125^{\circ} 0'$. Cacao, is cultivated in the high lands, but mostly on the coasts. The plantations of it are even now considerable, and this branch of industry only requires not to be impeded by any obstacles, in order to be still further extended. It forms a large ingredient in the trade, and furnishes many petty traders with their daily bread, not to speak of the land-owners for whom the cultivation of the cacao affords the only subsistence. The preparation of this product here differs from that in the West Indies 1,200 to 2,000 piculs of

MINAHASSA

125 pounds are yearly produced, the prices vary much, being from 50 to 75 florins

The sulphur Lake Lienong is situated near the negroy Lahendong Half way between Suongsong and Lahendong the sulphur is observed exuding from the ground and on the left, are several sulphureous marshes Everything here is barren and rude, and nature waste and inhospitable From the height at the back of negroy Lahendong, turning to the west you behold, on both sides of the Koriey mountain, the sea in the distance,—on the right, Lakon exposing its full dimensions,—at your feet the negroy Lahendong,—at your back lake Lienong about half a mile in circumference, formed by the mountains Tolauko, Lungkoan, Kasuiatan,—and Tempusu, below you The glittering of the waters of the lake beneath is exceedingly beautiful showing, from the volcanic action, different colours On the sides and at your feet you see the sulphur and the hot-water boiling up from the ground, the last at a heat of 200° to 202° Fah so that in two minutes an egg may be boiled in it On the other side of the lake, the aspect of nature is of a more terrific character, the hot water runs from the walls and shore into the lake, but it is of a lower temperature than that on the other side A boiling sulphur pool, thirty feet in diameter, first arrests attention It has a temperature of 140°, Fah while all around there is nothing but desolation and boiling water, this is the place where the count de Vidua lost his life in his zeal for exploration Not listening to the advice of the natives around him, he fell into the boiling mud It is remarkable that in the circumference of 30 or 40 feet different degrees of heat were found, 135°, 171°, 145°, and lower, 165° The volcanic direction near this lake is east and west, and the earthquakes there are felt in the same direction The lake, is 10 feet deep, has an outlet through the district Sonder, and near the negroy Tinji forms a most beautiful cascade In the lake Lienong, six different kinds of fish are found, viz, cabos, getegele, sayo lumulontik, komo and the largest kind of eels, and also a number of wild ducks and other water fowl At noon the thermometer was 75° Fah According to Professor Birkmore gold is found in great quantities in Celebes It occurs over all the northern peninsula from the Minahassa south to the isthmus of Palas Tavernier also relates that Celebes or Macassar produced gold also, which is drawn out of the rivers, where it flows among the land—*Tavernier's*

MINDORO, an island lying immediately
adjacent to the S W Coast of Luzon, being
separated only by a narrow strait The Ne-
guito race who are residing in the island are
congregated in a mountainous district, called
Bengan, where they live on friendly terms
with the Manguianes or wild tribes of the
brown race, by whom they are surrounded
although very little intercourse subsists be-
tween them The Mindoro sea is bounded
on the S W, side by the N E coast of Bor-
neo It is much resorted to by British sperm
whalers who obtain entire cargoes there
Mindoro Strait is 27 to 33 miles wide The
Manguianes are a mild but illused people,
they are so little advanced in civilization,
that European visitors, who have not had
opportunities of personal communication
with the Bngano often leave the island,
with the impression that they are only a more
savage variety of the same race —*Dickmore

Fire clay	Amber	Talc
Millstones	Diamond	Selenite
Corundum	Topaz	Petroleum
Garnet	Toumaline	Fullers Earth
Ruby,	Lapis lazuli	Red Earth
Topaz	Cinnamon stone	

Mineral samples of copper are known to occur in 17 or 18 different localities of Southern India, in the forms of green carbonate and grey and liver colored ores, but the metal has never been traced to good veins or nests. The green and liver colored oxides of copper are said to occur in Kunool, Cuddapah and Nellore. The Copper Mountain, Bellary does not contain a trace of copper, though it is a rich Hematitic iron ore.

Mewar is rich in metals, Mysore has iron ore, and Corundum, in abundance.

Beluchistan is rich in mineral productions, copper, lead, iron, antimony, sulphur, and alum, abound in various parts while common salt is too plentiful to be advantageous to vegetation. On the high road from Kelat to Kuch-Gundava is a range of hills, from which red salt, is extracted. Sulphur and alum are to be had at the

MINERAL SPRINGS

same place. Ferriar saw quantities of white and grey marble in the mountains to the westward of Nooshky, but it does not seem to be at all prized by the Beluch.

Chinese authors assert, that there are between four and five hundred mountains in the empire which produce copper, and that there are upwards of three thousand which produce iron. Gold and silver mines abound, but the policy of the Government discourages them being worked. The mines of the province of Kwei-chow supply all the mercury used for the manufacture of vermilion, and there are mines producing lead, tin, and calamine, scattered all over the country. Mining in general is discouraged by the emperor. Coal was used very early in China as fuel, it is mentioned by Du Halde as black stones dug out of the mountains, which stones burn when kindled, and are used by many persons in preference to wood, of which there is abundance. It is found in the north and in the south, and probably might be had in nearly every province in the empire. At Shaug-hae, it has been used on board Government steamers, in this district it resembles cannel coal, it is to be had also at Canton. Le Compté assures us that there is not any country better supplied with coal than China, and he particularizes the provinces of Shan-se, Shen-se, and Chih-le. *Sin's China and the Chinese*, Vol I p 424-425 — *Madras Exhibition Juries' Reports*.

MINERAL ACIDS The Indian method of preparing these is as yet imperfect and the manufacture is conducted on a small scale, only in such large cities as Lahore, Amritsar, &c, there is a factory also in Kashmir.

MINERAL OILS See Oil

MINERAL PITCH See Asphalte

MINERAL SPRINGS exist in many parts of the South and East of Asia. The succeeding list, has no pretension to being any thing more than a catalogue but includes, it is hoped, most of the mineral sources in India and its dependencies, of which accounts have been published. The names attached to the notices have been added, generally they are those of the discoverers, or rather describers, but in some instances of the analyses of the waters. Some springs, such as the Monghyr Seetkund, have been so long known, that it is uncertain who the original describers were. Capt Sherwill gives information about the Rajmahal and Bheerbhoom springs, Mr Edgeworth about those in Kulloo, Dr Fleming the ones in the Salt Range, and Mr A Young those in Sind. Major Sand-

ever there is a hot spring, there is pretty sure to be a temple, visited by pilgrims. Many have, however, been used medicinally. Some of those, which appear to be most resorted to, for their healing virtues, are the springs at Malacca, those at Sonah, near Delhi, where considerable buildings have been erected for the convenience of bathers, at Munnee Kain, and at the Lukkee Pass. All of them are thermal, and except Munnee Kain, are sulphuretted, and natives have undoubtedly faith in them in certain cases. Such springs might easily at a small expense be made more extensively useful to natives. Europeans can scarcely be said to have ever made a fair trial of any of the mineral springs of India. Mr Ludlow in 1826, suggested that the wells at Sonah should be made use of for European soldiers. Dr Murray attempted in 1843-44, to employ the sulphuretted and chalybeate springs in the valley below Landour for the benefit of the invalids at that sanatorium, but he never met with the support he deserved, and the situation of the springs at the bottom of a hot and confined though picturesque valley, was a very important obstacle to success. In 1846 they were found all but abandoned. That more attempts of the kind have not been made, that springs of as high virtue as those so prized in Europe, should have been neglected, must no doubt be a matter of surprise to people who have not visited India, or to foreigners, to whom of all but the poorer classes a visit to a bath is a yearly necessity, and to Germans, who publish annually some 30 new works on their watering-places, but not to those who are aware of the many practical difficulties to be contended with in this country. It is not, however, generally known in Europe, nor indeed in India, that mineral springs are so abundant in the East. Above 100 separate localities have been ascertained within the bounds of British India. There are hot springs in Ladak, Nepal, and Sikkim, at Uchebul in Cashmere, and hot sulphur springs near Rajourie, in Goolab Sing's territory. The mere absence of strong ingredients in the water, as in the Tenasserim and many of the Hazareebaugh hot springs, would be no essential obstacle to success in their use, for some of the popular European baths, as Matlock, Wildbad, Pfeffers, and Bad Gastein, are very deficient in salts, yet are found efficacious in many affections, being chiefly used for bathing. But the absence, at most seasons of the year, of a bracing climate, at the generality of the thermal springs in India, diminishes the chance of their ever proving of utility to Europeans. Perhaps the

climate of Hazareebaugh, which is 1,500 feet above the level of the sea, alone offers something of an exception to this remark. The mountain of Parisnath, in that district, 4,500 feet above the sea has a space on the ridge at its summit, far too limited for more than two or three bungalows, and there would be much difficulty in procuring a proper supply of drinking water for any number of people.

The sulphuretted spring at Chaunch is only twenty miles from the terminus, and about three miles off the Grand Trunk Road. It is prettily situated, not far from the Pachete hills, and there is a colliery near. But there is a much more abundant and hotter one called Tanloie, on the banks of the Damooda, two or three miles off. Those at Bum Buklesu are about fifteen miles from Mungulpore, and the same distance from Sooree. They are further off the high road, but are more powerful and abundant. The hot spring at Lakarakunda is not far off, and there is said to be another near at Kisshun. The elevation of all them may be about 300 feet above the sea level. Of these places, Bum Buklesu, is particularly deserving of an early investigation, for no analysis of its waters has yet been made. There are four or five springs the temperature at least of the hottest, which is 162° , exceeds that of the most popular springs of the kind, Aix la Chapelle, or Bades and Caunterets in the Pyrenees. During the four cold weather months the climate is probably not inferior to that of any of those places in their short bath season. Indeed, but for the peculiar arrangements of society in India, depending on Europeans being buds of passage, and not colonists, but for the absence here of any season of general relaxation from business these wells might, if there be no local objection to them, have long ago been found of much utility to the inhabitants of Calcutta. But the facility of communication with England and of going to sea, enjoyed by Calcutta people, has led to indifference about the sanitary resources of the country, and to the neglect of Cherra Poonjee and Darjeeling, or rather to their never being fully appreciated, and to the abandonment of the only sanatorium they had on the sea-coast, Poonie, not that it was ever in very high favor. A few of the residents of Cuttack still go there, during the hot months, but we never hear of any one visiting it from Calcutta. In fact, sea bathing, or any other kind of bathing, except for purposes of ablution, is scarcely known in Bengal, and probably not much practised in any part of India. Cooitallum, not very

far from Cape Comorin, is a large place with several bungalows close into the hills. The well known cataracts are close at hand. The lowest cataract falls from a height of 200 feet. The average temperature of the water is 72° to 75° and invalids derive great benefit from bathing in it. The bathing place is under a shelving rock, affording the most delightful shower-bath possible. The climate is particularly enjoyable to Europeans in June, July and August. The scenery is splendid, there are in all three falls, the highest being 2,000 feet above the sea. Amherst, or Negrais, may be useful to the occupants of British Burmah. Sind abounds in mineral waters, but the situation of the province and its climate alike preclude the hope of their ever being extensively useful to Europeans, though they might be more employed for sepoys, and the people of the country. The thermal springs of the southern Concan do not appear to be powerful, and they have no advantage as to climate. At Ramandhoog there is a small plateau 3,198 feet above the sea, climate cool, invigorating and healthful, 13° to 14° cooler than Bellary, the table land is 2,735 yards long by extreme breadth 996 yards. The climate must make the sulphur springs of Bhadiahellum useless for Europeans, even if in other respects they were promising. The higher portion of the Jullundur is a tract abounding in mineral wells of all descriptions, where the icy stream of the Paibutti, close to the boiling fountain of Munneekain, which rises in a jet at an elevation of 5,587 feet, could furnish Russian baths, if they were desired, and where the immediate vicinity of a chalybeate is not to be forgotten. Where some are reported to contain Iodine or Bromine (the asserted presence of less than $\frac{1}{2}$ of a grain of iodine, in 16 ounces of the water, was the making of the Saline of Kieutznach), and where some must possess the advantage of an almost European climate. In this district also and on the banks of the Beas, is Bishnit, at an elevation of 6,681 feet, with an ample thermal sulphuretted source. Gerard says, there are a few mineral springs impregnated with salt, iron and alum, that may possess medicinal virtues, and the famous wells of Zungsum, at the meeting of the Specotee and Parati rivers, 4 miles north of Shealkhur, whose inscriptions in the Tartar language on tablets of stone describe the particular virtues of each spring, are scarcely beyond the limits of Kunawun.

Bum Buklesu is a pretty and curious

spot, easily accessible. It is healthy and not jungly, being situated in a well-cultivated country, with a little jungle to its south. It is one mile from the large town of Tantipara, on the banks of a small nullah, called the Buklesu. There are five or six hot springs, the whole group called Bum Buklesu. The hot wells that have been surrounded with masonry walls are immediately on the north or right bank of the nullah. There are numerous hot springs in the bed of the nullah only to be seen in the dry season, giving out the well-known smell of sulphuretted hydrogen, with which the air is tainted. Near the hot springs there are several cold ones, all issuing from a tough gneiss rock. The hot and cold springs are only separated by a few feet from each other. The body of water ejected from the hottest well is very considerable, being about 120 cubic feet per minute, it runs from innumerable small orifices in an accumulation of mud and dirt, the rock being nowhere visible within the masonry of the tank. In the hottest water 162° , a green shining coniferia thrives. Another spring is 123° , and the coolest 83° . Some 3 or 400 feet from the bank of the river, among the dilapidated temples, there is a large pukka tank which is supplied by two springs, one hot and the other cold, so that at one end the water is warm, at the other cold, and in the centre tepid. The stream of the nullah is about 50 yards across, with a brisk current, and it retains its heat below the springs for a considerable distance, its temperature was 83° in the month of December, when the temperature of the air was in the shade 77° . The sand of the stream some little way from the spring, and at the depth of six inches, is intolerably hot to the hand. Extending for about 200 yards along the right bank of the stream, are 120 small brick and mortar Vihara or temples, built by various pilgrims, each containing a Prapara or emblem of Maha Deo. Only one temple has any pretension to architectural elegance. Numerous attendant brahmins, who are most importunate beggars, loiter about the temples, engaged in bathing in the hot stream, or watching the cremation of dead bodies, which operation is constantly being carried on. Tantipara is a fine substantial village, with most of its inhabitants engaged in preparing silk for the Calcutta market, there is an indigo factory besides a police chokri and abkari station, a short way off is the large town of Dobrajpoore, offering a good market for English piece goods, and producing a large supply of fish from its numerous tanks. Between it and Bum Buklesu, and in the town of Dobrajpoore, large naked and

picturesque masses of granite and gneiss protrude through the soil, occupying altogether about a mile square. The scene is a very curious one. In the opposite direction, but further away, is Nagore, or Jy Nuggur, a large town, the greater part of it has gone to decay, as is shown by its falling mosques, its half-filled and weed-choked masonry tanks, and its ruined buildings which almost approach to palaces in extent. The famous Nagore wall or entrenchment, extends in an irregular and broken figure round the town of Nagore, at a distance of about 4 miles, its length is about 32 miles. At Lakarakoonda, about 5 miles off, is a warm spring, temp 85° . Near the feeble stream which carries away its waters is a curious cut stone Hindu temple, which is fast falling into ruin.

Panyab The mineral springs of the Panjab are always situated either in the hills or in submontane districts, there are hot springs, saline and sulphurous waters, and petrifying streams, in limestone districts, are not uncommon. The Jawala Mukhi range is a portion of the outer parallel of the sub-Himalaya. It is composed of a sandstone of the later tertiary period. The springs are situated all within a distance of about 30 miles near the base of the hills, on their south westerly face, looking towards the Beas, all contain chloride of sodium common salt and iodine, stated by Mr Macadieu, to be in the form of iodide of potassium in considerable quantity. In proceeding by order of their respective positions, and taking for a starting point the limits of the Jawala Mukhi valley, naturally formed by an elbow of the Beas near Nadaun, the salt iodurated springs are placed in the following order, 1st Koopeeah, 2nd Jawala, (two springs), 3rd Jowala Mukhi, 4th Nageeah, and 5th Kanga Bassa. All the water from the five springs, one at Koopeeah, three at Jawala, one at Nageeah and one at Kanga Bassa, after having undergone slight concentration by being exposed only for a few hours to the open air, is purchased by the bunnahs at one anna per seer, or exchanged for the same value in attah, &c. The livelihood of the natives living in the vicinity of these springs is chiefly earned by this trade. They are convinced and tell all who question them that the water contains an efficacious principle which promotes the cure of the goitre. Nature offers this remedy ready formed, and in large proportions without the excess being injurious, and there is a chance of finding a sufficient quantity of the salt to render it profitable in a commercial point of view. While the Jawala Mukhi waters

contain a large per-centage of iodine, Dr Fleming states as the result of his analysis that not a trace of it can be found in the rock salt of Mandi. The sulphurated hydrogen spring at Danera, is considered sacred by the natives, who resort to it for cure in goitre and other diseases, it is situated about a quarter of a mile off the main road to Danera. The spring is not a thermal one, but its exact temperature has not been observed. A small way-side spring in the hills, near Dalhousie, has a strong chalybeate taste, and deposits the reddish precipitate indicative of iron. The temperature of Bishasht spring is 102° Fahr that of the principal spring at Manikarn 202° Fahr.

The springs of mineral waters which occur in China, are generally thermal, or solfataras, yielding sulphurous gases, steam and warm-water, and their warm character gives them their Chinese names Wan-ts'uen, Wan-t'ang and Fuh-ts'uen. The hot sulphur mines of Tung-t'ang are about 50 miles from Chefoo. They resemble those of Atami in Japan, and are useful in skin diseases and the contractions and pains of rheumatism and other diseases. Twenty miles N N W from Macao is the island of Hwangshan, in which the hot springs Yungmah occur, with a temperature of 170° . The waters contain salt, sulphate of Soda, Chloride of Calcium, and are useful in skin diseases. In the gypsum districts of the division of Yung-ching in Hu-peh, are several warm medicinal springs, resorted to by the sick. Large quantity of salt and fibrous gypsum come from these places in Yung-ching. Hwang-shan, a hill to the west of Hwui-chau-fu, city, in Ngan-hwui, has cinabab springs which are reddened at times and are hot enough to make tea. A clear, hot, spring Yuh-shih ts'uen, is met with at Li-shan, near Si-ngan-fu (Shen-si). At the Lu-Shan, near Kiu-Kiang (Kiang-si) are warm springs, once much vaunted for their efficacy, in syphilitic, leprosy and exanthematic disorders. At Li-en, in Shen-si is a carbonated spring called Li-ts'uen or Kam-ts'uen, whose sweet waters were deemed to encourage vegetation and to prolong life, and to be cooling, stomachic and corrective. To the S E of the city of Hoh-king-chau, in Li-kiang-fu (Yunnan) are warm mineral springs, esteemed in the treatment of abdominal tumours. There is the celebrated well of A-yih, at a place about 60 li to the N E of the district city of Yang-ku in Kwan-chau-fu, (Shan-tung), anciently called O-yih or A-yih. The well is seventy Chinese feet deep and its waters have a gela-

MINERAL SPRINGS

tinuous principle like the waters of Bareges in France. The water is evaporated and produces a gelatine called O'Kian or Assesglue.

In Formosa, at its Northern end, 1750 feet above the sea, are sulphur pits, in the rocky gorge of a mountain, and eighty-five miles East of Tamsui, and clouds of steam and sulphureous vapour issue from rents in the rocks. There are several hot springs and pools, and a miniature Geyser throws intermitting jets of boiling water to a height of fifty or sixty feet. Another solfatara is near the village of Kim-pao-li some seven or eight miles to the N W of Kelung. In Japan similar solfatara occur, in the department of Satsuma, in the island of Kiu-siu. The ground is volcanic and impregnated with sulphur. At the southern end of Satsuma is the burning sulphur island of Ivoo-sima.

1 Sulphuretted Mineral Springs

Malacca thermal — *Ward*
Spring, 27 miles N from Hazareebagh, thermal — *H H Wilson*
Bum Buklesu, thermal, 16 miles, W and S of Soorie in Bheerbhoom — *Sherwill*

Buume Verte,	FR	Nana,	PERs
Frauen murze,	GER	Widda,	TUR
Pudina, Nana, Guz	HIND		

Dried Mint is more commonly used by
Europeans than natives, but is esteemed as a
medicine by the latter Dogs refuse to sleep
on rugs beneath which mint has been placed,
and this simple plant thus affords a good
means of ensuring cleanliness Mint is
occasionally prescribed by mahomedan
practitioners in dyspeptic complaints, and to
stop vomiting Several kinds are distin-
guished, all remarkable for their peculiar
odour and taste The common sorts are
three, spear-mint, pepper-mint and penny
royal, also *Mentha hirsuta*, *M. crispata* and
M. canadensis The first is generally used
for culinary purposes it may be propagated
by layers, or cuttings, or parting of the roots,
it requires a moderate proportion of water
In the rains a small black caterpillar attacks
the leaves, and will destroy the whole bed
if not removed by hand or by flooding the
beds, when the insect becomes detached
from the leaves, and is easily destroyed
The mints are domestic medicines, carmina-
tive, antispasmodic, stomachic, astringent,
sudorific and alexipharmic — *Riddell Faulk-
ner Powell, Hand-Book V 1 p 301 Smith
p 150*

MINTRA A tribe in the Malay penin-
sula with numerous superstitions, but be-
lieving in another world The Mintia are
not so advanced in cultivation and arts as
the Crean of the Tenasserim Coast, these

MIRABAN

last cultivate cotton, and make their own cloth, which is not the case with the Mintia. The Crean have also many vegetables which are unknown to this tribe. The Mintia clear a small piece of ground in March, in July they set fire to the trees which are then sufficiently dried, and at the beginning of September they plant paddy, cludy, &c, then Ladang is so small that their harvest of rice is enough only for a couple of months, the cludy being then their only food for the remainder of the year. The Mintia are very partial to the flesh of monkeys, and if the use of it was not prohibited by the Koran, there is no doubt that the generality of them would have been converted to Islamism. To procure it they use the sumpitan, which is a bamboo from 6 to 8 feet long, the arrows are slips of bamboo 10 inches long, with a piece of light wood at the bottom, shaped to the bore of the tube, which they propel by blowing hard. The point of the arrow being anointed with a prepared poison called thipoh, communicates it to the blood and after two or three minutes the animal vomits and falls dead. Should the arrow penetrate the skin of large animals, many of them die, but they are generally lost to the sportsman, as they are able to run, after having been wounded, to a great distance. These savages seldom miss their aim but will shoot with their arrows monkeys seated on trees of seventy or eighty feet high, one wounded animal, after jumping on some other branches, and throwing away what he was eating, immediately after fell down.—*Jour Ind Arch Vol V No 8, August 1851*

Cultivated as an ornament in most gardens, root considered as an aperient by the native doctors, &c but Drs Hunter and Shoolbred tried it without satisfactory results, and Dr O'Shaughnessy's experiments lead him to believe it destitute of any efficacy. It is at best an uncertain cathartic though the roots were long regarded as the source of the true jalap, their taste is acid and nauseous, and they abound in starch, the seeds also contain this principle in such abundance that they have been proposed as an alimentary article. The Mirabilis dichotoma and longiflora are reputed to possess similar properties. The Marvel of Peru has flowers of various colours, red, white and yellow, also variegated red and white, yellow and white. The root when dried is prepared for medicinal use. It becomes in a short time quite a weed in a garden. Is propagated by seed and in any soil.—*O'Shaughnessy, p 511 Riddell Birdwood, Mason, Powell*

MIRAFRA Confining this genus of birds to the species devoid of narial tufts, Mr Blyth distinguishes Spizalanda, Blyth, ex M Hays, Jerdon, which is a peculiar and rather thick billed and true lark, as shown by the form of the wing, &c, and Annonomanes Cabanis, ex M Phoeniceus, Franklin, Al Lusitana, Gmelin, (v deserta, Licht, isabellina Tem, et M phoeniceoides, Blyth,) and probably M cordufanica, Strickland, to which he suspects that A cinnamomea, Bonap, should be referred. The prior establishment of the genus Annonomanes is known and A cinnamomea (cordufanica?) is correctly referred to it, also the Alauda pallida, Ehrenberg, with possibly, Budytes viridis (Motacilla viridis, Scopoli,) founded on the bad figure in Brown's Ill Orn pl 33 f; 2, M, lustrigata, Raffles, B melanocephala, et B beema, Sykes, B neglecta, melanocephala, et flava, apud Jerdon, Catal, M melanocephala, Lichtenstein, B flava vel neglecta et B Rayi vel flaveola of India and the Malay countries auctorum) —*P Z S Nov 26th 1850 Rev Zool, &c, 1851 p 178 M Blyth's Report*

waterless sea	"	Sei ab	PER
Si kot	Hind.		"

It is said that beasts are never deceived by the mirage. But, to man, the distress occasioned in Arabia by a deficiency of water is frequently increased by the tantalizing appearance presented by the mirage in that country. The light reflected in the reflected air immediately above the heated ground gives rise to the resemblance of an extensive lake and the thirsty traveller, advancing towards it finds the flattering delusion recede before him. In the early part of the morning, while some dew remains on the ground, the perception is remarkably strong, every object is then also magnified, so that shrubs appear as trees, and under them frequently appear their images inverted, as if reflected from the surface of water.

In the desert of Dhat and Oomra-Soomra, where the shepherds pasture flocks, and especially where the alkaline plant is produced, the stratification is very horizontal, and produces much of the mirage. It is this illusion to which the inspired writer refers, when he says "the mock pool of the desert shall become real water." The inhabitants of the desert term it Chitram, literally, the picture, by no means an unhappy designation. This optical deception is well known to the Rajpoots, is called "see-kot" or 'winter castle,' because chiefly visible in the cold season, hence, possibly originated the equally illusory and delightful 'Chateau en Espagne,' so well known in Europe.

It is to be seen in every part of British India just as Eothen describes the likeness of a fresh water lake, like a broad sheet of calm water, that stretches far towards the south—stretching deep into winding creeks, and hemmed in by jutting promontories, and shelving smooth off towards the shallow side, on its bosom the reflected fire of the sun lay playing, and seeming to float upon waters deep, and still.

Though, says he, I knew of the cheat, it was not till the spongy foot of my camel had almost trodden in the seeming waters, that I could undeceive my eyes, for the shore line was quite true, and natural. I soon saw the cause of the phantasm. A sheet of water, heavily impregnated with salts, had filled this great hollow, and when dried up by evaporation had left a white saline deposit, that exactly marked the space which the waters had covered, and thus sketched a true shore-line. The minute crystals of the salt sparkled in the sun, and so looked like

the face of a lake that is calm, and smooth—*Eothen's Travel from the East* p 271

MIR-DAH PERS literally a master of ten, the Chief of peons, also a land measurer, who must measure with a standard yard, or guz, with the seal of the principal town of the district affixed to it. The Illah-e guz, as fixed by Akbar is the one used (Vide Ayeen Akbery, 4to Ed Vol I p 354)
—Malcolm's Central India Vol II p 30

MIRGH, PSHU A leopard

MIRI, a hill tribe on the Eastern frontier of the Aboi area. They all wear some woollen article of dress. They use the bow and poisoned arrow. The Miri are allied to the Aboi, Dofla or Aka, rather than to the Mishmi. The Miri have their chief seat in the low hills north of Banskotta and Lukim-

pmi, but the exactions and cruel ravages of their formidable neighbors the Abor, have compelled them to migrate in large numbers into the plains of Upper Assam. Mr. Roberson remarks that a partial comparison of the dialects spoken by these tribes furnishes abundant evidence of their original consanguinity, while the coincidence between their vocables and the terms in common use by the Tibetan tribes, is frequent and unequivocal. The Mui race occupy the north banks of the Brahmaputra in Lat $27^{\circ} 50' N$ and Long $94^{\circ} 30' E$ in the western part of the valley of Assam, they are to the S W of the Abor.

The Bibor, Jubar and Kultr or Koltra, are populations to the north and east of the Abor and Mishmi localities, on the drainage of the Brahmaputra. In the end of 1861 the Meyong Abor attacked and plundered a village in the British territory, but the tribe expressed a desire to renew friendly relations, and begged that their offences might be overlooked. On the 5th November 1862, an agreement was made with them binding them to respect British territory, and the same engagement was subscribed on the 16th January 1863 by the Kelong Abor. On the 8th November 1862, a similar engagement was concluded with the Abor of the Dihong-Dibang dnar. The Abor Mui language belongs to the old Assam alliance, but it has been greatly modified by Tibetan. It has a strong ideologic resemblance to the Dhimal, Bodo, Guro and Naga, but with some specific Tibetan traits — *Journal of the Indian Archipelago*, Nov. iv and v April and May 1853 p 190, *Treaties, Engagements and Summits*, Vol. vii, p 343, *Indian Annals*, *Latham's Descriptive Ethnology* Campbell, p 54. See India, Singpo.

MIRIALU, TFL. Black Pepper.

MIRIALTIGA, TFL. Piper tricoecum.

MIR JAFFIR, in 1702, was appointed dewan of Bengal and viceroy of the three subahs, Bengal, Behar and Orissa. He was of a poor brahmin family, of the Deccan, but was purchased by a Persian merchant and converted to mahomedanism. He rose to distinction under Aurangzeb who styled him Mirshid Kuli Khan, and Mirshedabad was called after him. He remodelled the revenue system of Toder Mull. He was a great and an energetic ruler and died in 1725.

MIR JAFFIR KHAN, after Suraj and Dowlah's death, succeeded to the supremacy in Bengal in 1757.

MIR JUMLA a native of Persia, a servant of the Kantah Shahi king of Golconda, afterwards a general of Aurangzeb, he died at Dacca about 1662.

MIR-KHOND, the historian, names himself Muhammed-bin-Khmvand Shah-bin Mahmud. His celebrated book is styled *Ranzat us Safa* or *Garden of Purity*. He was born in 1132, flourished at the court of Husen Muza at Herat, and wrote a general history of Persia, from the creation to the year 1171, which he entitled *Ranzat-us-Safa*. After many years of disappointment from want of patronage, he was at length befriended by the magnificent minister Ali Shih Beg, who obtained him a suitable dwelling near Herat, and assisted him in collecting materials. Mir-Khond died in 1198, and his son, Khondemur, wrote an abridgment of his father's work, which he called *Khalasat-al-Akhhir*. Teixeira, a Portuguese traveller, published a translated abstract of Mir-Khond, and there is an English translation of Teixeira, by Stephens, but the best translation of that portion of Mir-Khond's work, which relates to the history of Timur's conquests, was published in Major David Price's *Mohammedan history*, in 1821. There is also a translation of Mir-Khond's history of the early kings of Iran, published by David Shea in 1832. His book is divided into a Preface, seven Parts or Sections, and a conclusion. Each part makes a very thick volume in toto. He wrote it at Herat in a caravansera called *canehalo-eulasya*, built by the vicer Mir Ali Shih, to whom he dedicated this work, which he entitled *Ranzat-us-safa hsu it ul anhm, o ul mulue, o ul kulafa*, which signifies, *The Garden of Pleasure, touching the Lives of the Prophets, Kings and Khilifs*. The Preface treats of the Science, or Art of Chronological History. *History of Genhuzean* p 429 — *Onseley's Travels* Vol. II p 392 f. *Markham's Embassy* p xxviii. See Khondemur.

MIR MAHOMED MASUM, author of *Tarikh-us-Sind*, a history of the conquest of Sind by the Arabs, and down to the time of Akbar. He took the takhallus of Nami. He was born at Bhakkar in Sind and wrote A. D. 1600. *Elliot's Hist of India*.

MIRMALENZI, PERS. Peshi, a water melon of Candahar.

MIRDA—? A migratory shepherd race in the South of India — *Wilson's Gloss*.

MIRZA, PERS. An honorary title, from two Persian words *amir-zadah*, nobly born; when prefixed to a name as Mirza Abdul Bakir Khan, it means a secretary, a moonshih, when suffixed as Abbas Mirza, it means prince Abbas.

MIRU one of the most delightful villages of Kumaon, beingivalled only by Rogi and Chini, beyond which the climate becomes too mild for beauty. The crops at Miru, both of grain and fruit, are most luxuriant, and the vine thrives to perfection. The scenery around Miru is indescribably beautiful, as it almost overhangs the Sutlej 3,000 feet below, while beyond the river the mountain-slopes are densely wooded, yet often rocky and with every variation of form. A single peak, still streaked with snow, but too steep for much to lie, rises almost due opposite, behind which the summits of the chain south of the Sutlej rise to an elevation of upwards of 18,000 feet—Dr Thomson's *Travels in Western Himalaya and Tibet*, page 71.

MIRZAPUR, a town of the Benares district on the right side of the Ganges, in L 25°9' 3", L 82°33' 9" 362 feet above the sea. Mirzapore has no ancient importance or renown like Rajmahal, Bhagulpore, Monglu, Patna, Benares, but, excepting the last, it has eclipsed all the towns and cities in the Gangetic valley. It has grown and prospered under the British rule since the latter part of the 18th century and as a mart of trade ranks next to Calcutta and Bombay. Its corn, cotton, and the dyes of one-sixth of India, are sold here. Mirzapore has risen purely from commercial causes, unconnected with

MIRZA-SALIM

religion or the auspices of royalty. In Mirzapore is seen the most beautiful chowk of all India. Four miles from Mirzapore is the temple of Bindachul. Here is seen the only instance of Kali in all Hindoostan. Forest races occupy the mountainous region of India from Mirzapore to the shores of the Bay of Bengal, and along the Eastern and Western ghaut mountains running on both sides of the peninsula. The Cheroo race are found in Ghazeeপুর, a part of Gorakhpur, the southern part of Benares and Mirzapur and Behar. They are sometimes said to be a branch of the Bhur. They seem to be the same as the Savira or Seoriee, but Buchanan considers them distinct. The Cheroo declare themselves to be descended from the great serpent, from which they may be supposed to be the Nagbunsi of Magadha. Remains of buildings attributed to them are found near Budha Gya, Sasram and Ramghur, and the images of Siva and Hanuman found in them indicate that they belonged to the Hindu religion. They appear to have been expelled from their ancient abodes by the Pramara of Bhojpur, the Hyobun of Hundi and the Bhoonhai, a little before the first mahomedan invasion, about which time there seems to have been a general convulsion in India, during which several tribes acquired their present possessions. The features of the Cheroo are said to resemble the occupants of the Vindhya mountains. They live by cutting timber, collecting drugs, and killing game, and though their numbers are very low, they continue to create a rajah for every five or six houses, and invest him with the tilak in due form. The emperor Sher Shah subdued Muhartu, a Cheroo zemindar of Behar, which seems to have been a last strong effort of the Cheroo race. The chief of Singrowli in Mirzapur is a Cheroo, though he calls himself a Benban. Sir H Elliot suggests that the Sivira, Seon and Cheroo, may perhaps be the Samia, descendants of the Suraseni. In the Harivansa is the following passage—"from this race came the Samavira and Sauraseni. The great king Samasena has given his name to the country over which he reigned" *Elliot's Supp Glossary Travel of Hind Vols I p 136 137*

MIRZA-SALIM, the Jehangir of Indian history, was born near the abode of Moin-ud-Din, Chisti. They show to this day 'the little roof of tiles, close to the original little dingy mosque of the old hermit, where the empress gave birth to Jehangir.' There is not a greater among mahomedan saints than the wali Moin-ud-din, who was a Persian of Cheest, but whose holy dust remains in

Ajmir The empress happened to be pregnant about the time, and remained in the vicinity of the old man's hermitage, till the promised boy was born—*The Hind*, Vol II p 4

MIR-ZUN-JOOSH, ARAB MYJOMAM

MIRZWIEBEL, properly Meerzwiebel, GER Squill

MIS or MISSI HIND Sulphate of Copper

MISHMI, a race N E of the Abor and Mii-Abor hills occupying the hills in lat 28 N and long 96 to 97 E on the north of the Brahmaputra river at its source. They are N W of the Langtam range. In the country to the east of Assam, between India and China, the Mishmi mountains which occupy the most northerly part, are the southern and western slopes of a mass of snowy mountains which sweep round the N W of Assam from the east bank of the river Dihong to the sources of the Dihong. The Khamti and the Mishmi and the Midli or Chulkatsa Mishmi dwell to the east of the Dihong river on the north of the Lohit or Brahmaputra river between the North and East Bianches. They are divided into several tribes, one of which is the "Chulkatsa" or "Cup Haired." With them are mixed up Abor tribes and some Khamti tribes. The people of the Mishmi hills, have their frontier touching that of the Abor or Padam, on the drainage of the Dihong and Dibong, in small villages. The Mishmi and Padam acknowledge a common origin and eat together. They use the bow and cross-bow and poisoned arrows and are often at war on the surrounding tribes. Their chiefs dress in Chinese and Tibetan clothes and ornaments. Polygamy is allowed. The Mishmi sacrifice fowls and pigs to the rural deities. They engage in trade for iron and build suspension bridges. The Bubbhaja, Taving and Myhu are Mishmi tribes. The Singpo march on the N W with the Mishmi who occupy the eastern mountainous extremity of the basin of the Brahmaputra, and on the W and S W with the Naga and Manipuri tribes. In the interior of Arakan and between it, and the Kynduayn river, several tribes are scattered over the highlands to the south of the Kuki, Naga and Manipuri tribes, with Tibet, the northern banks of the Lohit, and through the Mishmi hills into Tibet called the Mishmi route. The Mishmi, who occupy the eastern extremity of the mountain borders of Assam, are said to have a rude phonology, characterised by peculiar tones and difficult consonants—*Journal of the Indian Archipelago*, Nos IV

and V April and May 1853, p 130 *Latham's Ethnology* See Eibor, Jubai, Kulta or Kohita and India

MISR, HIND Egypt

MISR In the districts of Gorakhpur, Azimghur and Benares, is an agricultural tribe who call themselves Bhun-har or Bhun-har. They claim to be brahmanas, and take the titles of Thakur, Misr, and Towari; the rajah of Benares belongs to them *Wilson's Glossary*

MISR, or Misra, less correctly Mishra, HIND Sansc, a name given to a brahman of the Kanujya tribe, and especially to the members of two of the sub-divisions, Go't, or families belonging to it, those of the Sandal, and Katyayana or Viswanutra Go't. The term Misr was conjectured to have been connected with the ancient name of Egypt Misr, as if some of the brahmanas had come from that country. It is more probably of affinity to Misra, mixed, indicating some mixture of race or family, the tradition of which has perished. See Misser

MISREYA, also Sitasira, also Seleya SANS Dill seed

MISRI-LEI, HIND Tamarix orientalis

Silib-misri, HIND Eulophia campestris

Shukak-ul-misri, HIND Elyngium planum

Shalgham-misri, HIND Canavallaria verticillata

MISS, PERS Copper

MISSI, AR HIND A powder made from gallnuts, sulphate of copper, steel filings, mirobalans, and the pods or gum of the keekui tree. The hindoo and mahomedan women use it in staining the teeth black. It is a vitriolic dentifrice to dye the teeth black. It is rubbed into the roots of the teeth, Burton says as an antiseptic, and a preservative against the effects of the quicklime chewed with betel nut. But the colour is between rust and verdigris and the appearance unnatural and offensive and it is more probably a custom resembling that of Japan, and like that of the Kyan of Prome, adopted to destroy the natural attractiveness of the married women, for it is only applied to married women's teeth

Heera-kassis, is a dry per-sulphate of iron, used in dyeing, in making ink, blackening leather, used in medicine, and made into, "Mi-si" to apply to the teeth To make

Black missi, take of Heera-kussees, chaipal haira, chooni-gond, hla tootiya, non filings, kuth, equal parts, pounded and mixed rubbed on the gums. For

White missi, take of Sufard soorum (crystallized carbonate of lime, double refracting spar), and cinnamon pounded together, is used as tooth powder

Suda kussees, is an impure sulphate of iron, the refuse from the manufactory of the sulphate of copper four seers for one rupee — *Herklots Gen Med Top p 137 Burton's Sind, Vol 1 p 277*

MISSEL THRUSH the *Turdus viscivorus*, performs an up-and-down migration on the western ranges of the Himalaya, being found at high elevations in summer, and in the more sheltered situations of the valleys during winter The black throated thrush, *Turdus atrogularis*, is generally distributed over the woods and cultivated tracts of these ranges The black throat is wanting in some varieties, and there are several well marked similarities to what has been called the red-necked thrush, *Turdus ruficollis*, which Mr Hodgson considers a distinct species *Adams, Sportsman in India*

MISSEMA, there are here no springs but there are several cisterns *Robinson's Travels, Vol 11 p 131*

MISSER, also *Mitter*, i e, *Mithia*, is a term given to brahmins in the Punjab and along the Ganges, where not distinguished as pundits or men of learning It seems to have been introduced by the mahomedans

MISSING, also *Messing*, also *Geelkoper*, *Dur Bliss*

MISSI SAFED, HIND Oxide of zinc

MISSI SIYA, HIND Oxide of manganese

MISSREYA, SANS *Anethum sowa*, *Roab*

MISWAK, HIND A twig of a tree used as a tooth brush, a substitute in India for a tooth brush, made from a twig of the *margosa* the rough *Achyranthes* *Careya arborea*, *Phyllanthus multiflorus*, and the *Palmyra* It is a twig of any soft wood chewed at one end and is generally used throughout the east, where brushes should be avoided, as the natives always suspect hogs bristles

MISWA HIND The butai miswa is the *Astragalus multiceps* — *Burton's Pilgrimage to Meccah, Vol 1 p 34 Herklots*

MITAKSHARA This is a work by Vijananeswara Bhatta who flourished in the tenth century of the christian era It is a commentary on the law-book of Yajna-

kya, which again is an abbreviation of *Manu*, composed in the fourth or fifth century and more suited to modern requirements than the older work The *Mitakshara* is still the chief authority in all parts of India on civil contracts and the law of inheritance and a good edition and translation are much to be desired The little work of Stenzler (Berlin 1849) contains a clear edition of the text and faithful translation of Yajna-*valka's* complets

MITE ENG Species of *Acarus* The *Acarus coffeæ* or coffee mite, is so small as to be hardly perceptible to the naked eye It is closely allied to the "red-spider" of the hot houses of Europe Nearly all the year round, but chiefly from November to April, it feeds on the upper side of the coffee leaves giving them a brownish sun burnt appearance Individual trees suffer from its attacks, but the aggregate damage from it is not great,

MITHA HIND Fresh, sweet, hence, *Mitha-nebu*, sweet cition, var of *Citrus medica*, also *Citrus limonium* *Citrus limetta* *Risso and Port*

MITHILA The country north of the Ganges, between the Gandak and Kosi rivers, comprehending the modern provinces of *Purania* and *Tibut* The remains of

MITHRIDATES

the capital founded by Janaka, and thence termed Janakapuri, are still to be seen, according to Buchanan, on the northern frontier, at the Janickpore of the maps

Nearly coeval in point of time with Ayodia was Mithila, the capital of a country of the same name, founded by Mithila, the grand son of Ieshwara. The name of Janaka, son of Mithila, eclipsed that of the founder, and became the patronymic of this branch of the Solar race. These are the two chief capitals of the kingdoms of the Solar line described in this early age, though there were others of a minor order, such as Rotas, Champapoor, &c, all founded previously to Rama. By the numerous dynasties of the Lunar race of Boodha many kingdoms were founded. Much has been said of the antiquity of Poorag, yet the first capital of the Indu or Lunar race appears to have been founded by Sehesia Aijoona, of the Hihya tribe. This was Maheswari on the Nerbudda, still existing in Maheswari. The rivalry between the Lunar race and that of the Sooria race of Ayodia, in whose aid the priesthood acted, and expelled Sehesia Aijoona from Maheswari, has been mentioned. A small branch of these ancient Hihya yet exist in the line of the Nerbudda, near the very top of the valley at Sohagpore, in Bhagel-khund, aware of their ancient lineage, and, though few in number, are still celebrated for their valour. Koosust'hulli Dwara, the capital of Krishna, was founded prior to Poorag, to Sooripore, or Mat'hora. The Bhagvat attributes the foundation of the city to Anut, the brother of Ieshwara, of the Solar race, but states not how or when the Yadu race became possessed thereof. The ancient annals of the Jessulmer family of the Yadu stock give the priority of foundation to Poorag next to Mat'hora, and last to Dwara. — *Tod's Rajasthan*, Vol I p 39 — *Wilson's Hindoo Th Vol I* p 298

MITRA the sun, the object of worship of the ancient Aryans, the Bactrian sun-god Mitra is not mentioned in the Gatha of Zoroaster. In the Vedas, he is rarely invoked alone but generally along with (Orinano-) Varuna, the heavenly vault. In the later Indian religion, Mitra is included as one of the Yajata and in the Mitra prayers he addresses Ahura mazda. It appears, that there were two forms of worship in Vedic India, the one domestic, universal, celebrated three times a day, — the other, rare and exceptional, but both blended by a compromise into one incongruous whole, and both gross, and sensual almost beyond belief. The worship of the elements was clearly the national faith, with its offerings of the fruits of the earth, soma juice, barley, milk and butter. Animal sacrifice came from without, corrupted more and more and at last losing sight altogether of its original import, and coming to them perhaps from the wild nomades of Central Asia. The fair inference is that India and fire worship was the later form on Indian ground. The so called aboriginal tribes still sacrifice buffaloes and other animals, but there is no trace of fire worship among them. On the other hand the Viswamitra or Agnisara, claim the honour of having been the first to introduce the worship both of Agni and Indra, in various sakta of the Veda. Viswat Mitra, however, was the name of a body of immigrants viswamitra, "the men, or people of Mithra

Agastya, a native of Tibet, is a mahamuni, of great celebrity in the legends of Southern India. He methodized the Tamil language, and is the chief Tamil medical authority. He is estimated to have lived in the sixth century B C, but the Tamilians suppose him to have lived long

anterior to this. According to hindu legend, Agastya was the son of Mitra and Varuna conjointly, and born in a water-jar along with Vasisht'ha. Having commanded the Vindhya mountain to lie prostrate till his return, he repaired to the South of India, to Kolapur, where he continued to reside and appears to have been mainly instrumental in introducing the hindu religion into the Peninsula — *Wilson's Hind Theat Vol 1 p 313 Rev W Taylor Di Caldwell As Soc Trans Vol III p 213 See Hindu*

MITRA'SANS a friend, from mid, love

MITRAGUPTA Son of Chandra Gupta, was known to the Greeks by the name of Allitio. Diamachus was an ambassador from the Greeks of Babylon to Mitra Gupta.

MITRA, a genus of shells. See Molluscs.

MITRA CORRUGATA, and Mitra Episcopalis. See *Voluta vespertilio*.

MIYAN, a Hindustani word for "Sir," is known to the Bedouins all over El Hejaz, they always address Indian mahomedans with this word, which has become contemptuous, on account of the low esteem in which the race is held. *Burton's Pilgrimage to Meccah Vol I p 341*

MIZDZHEGI. See India.

MIZPEH, See Sacrifice.

MIZRAK, a weapon peculiar to certain Arab tribes, as the Karaghî and the Lah-yami, and some, like the Hindayli near Meccah, make very pretty as well as very useful darts. The head is 15 or 16 inches long, no where broader than an inch — *Burton's Pilgrimage to Meccah, Vol I p 348*

MIZZ, AR, in colloquial Arabic *Misd*, are the tight-fitting inner slippers of soft Cordovan leather, worn as stockings inside

the slipper; they are always clean, so they may be retained in the mosque or on the divan — *Burton's Pilgrimage to Meccah Vol II p 34*

MJED, also Krasnoimjed, Rus. Copper.

MJEL, Rus. Chalk.

MJELOIZCHNUE; also Towann, Rus. Hardware.

MLECHCHA. A term applied by the Arian immigrants to the peoples whom they found occupying India. Now, a person, other than a hindu. This name long continued to be applied to all the unsubdued Un-Aryan tribes in India. The aboriginal Scythian inhabitants of India seem to have been subdued and transformed from mlechchas into sudias, by slow degrees. In the age of Manu they retained their independence, and the appellation of mlechcha in Bengal, Orissa and the Dekhan, but in the earlier period which is referred to in the historic legends of the Mahabarata, the mlechcha and dasya are mentioned as disputing the possession of Upper India itself, with the Arya, and in conjunction with certain tribes connected with the Lunar line, they succeeded in overrunning the territories of Sagara, the thirty-fifth king of the Solar dynasty. The mlechcha are alluded to in the Mudra Rakshasa, a fact corroborative of that drama's being written in the eleventh or twelfth century, when the Pat'han princes were pressing upon the hindu sovereignties. To the hindu, every man not twice born was a mlechcha — *Hind. Theat Vol II p 251*. See Hindoo, India, kashmiri Sudra, Mhia, Semitic races, Mnaskines, Gicks of Asia.

MOÆDAN. Those Arab tribes which are of a pure Arab race, live on the flesh of their buffaloes, cows, and horses, and on the produce of some little ploughing. The tribes, distinguished as noble by their possession of camels, are denominated Aleu-el-Aleamî, and the others Moædan. The latter are esteemed a middle class, between genuine Arabs and peasants. Niebuhr heard some tribes mentioned contemptuously, because they kept buffaloes and cows. The Moædan transport their dwellings from one country to another, according as pasturage fails them, so that a village often arises suddenly in a situation where, on the day before, not a hut was to be seen — *Niebuhr's Travels, Vol II p 159 160*

MOAGHA TEL. Morinda, *sp?*

MOAWIYAH IBN ABI SOFIAN was governor of Syria, but renounced allegiance to Ah, and proclaimed himself khalif of the western provinces. The khalif Moawiyah, after having (A D 671-678), for seven successive summers renewed the endeavour to take Constantinople, at length felt himself under the necessity of sending envoys to sue for peace from the emperor Constantine Pogonatus. The latter agreed, and sent the patriarch Joannes Petzigaudius (the Yenyo of the Chinese) to Damascus to conduct the negotiation with the Arabs. The result was that the latter pledged themselves to a thirty years' peace, and to pay to the empire every year 3000 pieces of gold, fifty slaves and fifty horses — *Yule, Cathay* I p 60

MOBID, ARAB, from *abid*, AR, a Paisee priest

MOBYE See Kaien, Shan

MOCDER-CANEEL, also Hout Kassie Dui *Cassia lignea*

MOCHA, a town in Arabia. It has no pretensions of antiquity having had its origin about 1430, by the people flocking around the learned Sheikh Ali Shaduli ibn Oman. About the beginning of the seventeenth century, the English and Dutch East India Companies established factories there, and carried on a lucrative commerce with the Indian ports. At this time the revenues amounted to Rs 75,000 per annum, ships from all parts of the East entered its harbour, and caravans from Egypt, and Syria, and from the Eastern nations of Europe flocked to its markets. In the beginning of the 18th century the French established a factory at Mocha, which was then at the height of its prosperity. Its trade with America and Europe continued unabated until 1839 when Aden having become a British Port, Mocha rapidly and steadily declined, its condition became indescribably deplorable, and in 1857 its Customs dues of Mocha sold for Rs 48,000. The country around Mocha is a barren plain. Mocha, has a population of twenty thousand — *Playfair's Aden*

MOGHUL, a term derived from the great Tartar Mongol tribes, is used in India as a distinction of their descendants As a title it was especially applied to the sovereigns of Delhi of the house of Timur, although they were equally at least of Turk descent, and presented in their appearance entirely Turkish characteristics Mahomedans in India are divided into the four great classes, Syed, Shaikh, Moghul and Pathan The Arab shaikh are of three origins the Koieshi Mahomed's tribe, the Siddegee, Abou Bakr's tribe, and the Ferooqee or Omeri's tribe The Syed or Sandat are all descendants of Mahomed through his daughter Fatimah The Moghul however are of two countries, the Iran or Persian and Toorian or Turkish The Pathan tribes are mahomedans from Afghanistan These classes may be and are often, indifferently of the shiah or sunnee sect of mahomedanism There are other small sects and classes, as the Nowaet, the Ghan-Melidi, Ishmaelee, Lubby, Bora, Moplak &c On the N W frontier the term Moghul, is applied to the people of Afghanistan who speak Persian In Kabul, the mahomedans are divided into Pathan and Moghul (or new Pathan) the latter being chiefly Kazzilbah There are considerable settlements of Syeds holding villages in jaghir The mahomedans termed Sheikhs are neither Moghul, Syed nor Pathan There are many respectable landholders and some village communities who take the designation of Sheikh, as for instance the old proprietors of Lucknow, when it was but a village Mr Campbell regards those in the north of India as possessing considerable traces of a north-western origin from the hilly countries of the North Western Asians being fairer and some of them with high features of the Asian type, handsome faces, features and beards The emperor Biber, who, though a Turk was himself descended by the mother's side from Mogul ancestors, gives the following

account of the Moguls in his service—"The horde of Moguls have uniformly been the authors of every kind of mischief and devastation" Being dispossessed of the northern parts of his dominions by the Usbeks, Baber determined to try his fortune in Hindoostan, whose distracted situation flattered his hopes of conquest. His residence at this time was at Cabul, from whence he undertook his first expedition across the Indus, in 1518. After this, he made four others and in the fifth (A. D. 1525) he defeated the emperor of Delhi, and put an end to the dynasty of Lodi. It is said that Baber crossed the Indus, this last time, with only 10,000 chosen horse, the enemy's generals, by their revolts, furnishing him with the rest of his army. Baber was the founder of the empire of the great Mogul in India, and was, after Timour, the greatest genius of his race, his memoirs, which he wrote during the latter part of his life, comprise one of the most curious and interesting works in eastern literature. The Mogul is not a gloomy, intolerant fanatic like the Patan, but good natured and conciliatory, who made it his policy to amalgamate the foreigner with the natives of the soil. Under the Mogul, arts, manners, costumes and tastes all took a new character. The Moghul assumes the suffix of Beg. They are comparatively few, in number, are generally fair people, of a larger physical frame than the Arab-Mahomedans and are all of unassuming manners. In more recent times, the term Moghul was applied by the nations of Europe to the localities which they have occupied or with which they have traded. With the Portuguese the northern part of Hindustan held by the Moghul sovereigns, was styled Mogor, and Goa and the Western Coast of the Peninsula was to them India, just as the British now designate as India all their possessions in Hindustan and the two Peninsulas, and as with the Dutch now, India means Java, Sumatra, and the Netherland possessions in the Archipelago. The Moghul dynasties of India beyond palaces and tombs, porticoes and temples have, however, left little worthy of emulation. There are a few useful sarais and bridges, but of these many were erected by private persons. The aborigines of Bokhara are the Tajik whose origin and time of immigration to Bokhara are unknown, previous to the conclusion of the first century of the hijra, the Arab mahomedans penetrated into their abodes, and forced them at the point of the sword to embrace the new creed. At that period, Bokhara was govern-

ed by the race of the Samanides. In the tenth century, the weak rule of these princes was totally overthrown by the Usbeks, whose power was not of long duration, for in the twelfth century the khanat of Bokhara was deluged by the overwhelming flood of the Moghul hordes of Chenghiz-khan, and the Usbeks were expelled by the Moghuls into the desert to the west of the Sai-i-Daniya. *Campbell*, p. 100-101 — *Elphinstone's History of India* Vol. II p. 37 *Rennell, Memoir* p. lvi *Travels, of a Hind* V. II p. 255 *Yule, Cathay* II p. 549.

MOGILI, TFL. Caldera bush, Pandanus odoratissimus Mogili-pu, its flower.

MOGOR, Mogol, a Mahanum faqeer.

MOGOR, with the missionaries of the 15th century and the Portuguese, was then name for Hindustan, held by the Moghul sovereigns, with them India meant Goa and the Western Coast just as with the Dutch now India means Java and Sumatra, *Yule Cathay* II p. 549.

MOHAMMERAH a town in the Persian gulf at which the Indian army landed in 1855 when attacking Persia. After a great accession to its waters, the Shatt el Arab inclines a little more towards the South, during the remainder of its course it passes many large villages, and almost continuous belts of date-groves, and at length it reaches the sea, which, at the bar, is forty miles from Mohammera. See Chaldea, Kajar, Khuzistan, Arabistan, Mesopotamia.

MOHANA, a fisherman caste in Sindh, who appear to be a tribe of converted hindus. Their own account of their origin, however, is as follows — When Sulayman, the son of David, was amusing himself by ballooning over Cashmir, he met a horrible looking woman, and, although the wisest of human beings, was puzzled to conceive what manner of

man it could be that would marry her. Some time afterwards, the prophet king lost his magic ring by the wiles of Sakhar, the demon, who ascended his throne, seized the palace and drove out its lawful owner Sulayman, impelled by destiny, wandered to Cashmir, and there became the husband of that "gimme ladye." Her dowry was every second fish caught by her father, who happened to be a fisherman. As usual in such tales, the demon soon lost the ring, and it was found in the stomach of one of the fishes. Thus Sulayman recovered his kingdom. His wife, who remained behind in a state of pregnancy, had a son, who became the sue of the Mohana. The Mohana do not look like the Sindh people. Their features are peculiar and the complexion very dark. Some of the women are handsome when young, but hardship, exposure to the air, and other causes, soon deprive them of their charms. They are to be found chiefly about the lakes of Manchar, Manyar and Kinjur. At the latter of these places are some ruins of a palace built by Jam Tamachi, one of the rulers of Sindh, who married Nuren, the beautiful daughter of a fisherman. The event is celebrated in the legends of the country, and Shah Bhetao, the poet, has given it a Sindh immortality in one of his Sufi effusions. The Mohana are by no means a moral people. Their language is gross in the extreme, and chastity seems to be unknown to them. The men are hardy and industrious, but incurably addicted to bhang, opium, and all kinds of intoxication. Probably, their comfortless and precarious life, half of which is spent in or near the water, drives them to debauchery. They are admirable swimmers, as might be expected. The children begin that exercise almost as soon as they can walk. The Mohana, though depraved, are by no means unreligious. They keep up regular mosques and places of worship, with Piri, Mulla, and all the appurtenances of devotion. The river Indus is adored by them under the name of Khwajeh Khizi, and is periodically propitiated by a cast offering of rice, in earthen pots covered with red cloth. There are many different clans among the Mohana race. Their caste disputes are settled by the head men, who are called "Changa Mursa," and invested with full powers to administer justice to those who consult them. After betrothal, the prudent parents do all they can to prevent the parties meeting, both, however, are permitted to visit one another's relations of the same sex. Among the upper classes any premarital matrimony is considered disgraceful, but accidents

are not of rare occurrence. It is the same in Afghanistan, and other parts of Central Asia, where the mother of the betrothed not unfrequently connives at what is called Namzad-bazi, or visiting the future bride, unknown to the father. The word, however, does not imply any scandalous occurrence, and of course where the use of the sabie is so untrammelled the danger is diminished. In Sindh the lower classes, such as the Mohana and others, think they have a right to intrigue with their future brides. Some of them will go so far as to consider the mother-in-law a substitute for her daughter until the latter is of an age to be married.—*Burton's Sindh*, pp 251, 252-3, 261-2

Mollusc is a term derived from the Latin word mollis, soft, and molluses are animals whose bodies are soft, but are mostly protected by an external shell With naturalists, the whole of the animals of the world are arranged as under,

Kingdom, ANIMATIA

Sub-Kingdom 1, VERTEBRATA

Class 1 Mammalia	Class III Reptilia.
" II Aves	" IV Pisces

Sub-Kingdom II MOLLUSCA

Class 1 Cephalopoda	Class IV Brachiopoda
Class II Gasteropoda	Class V Conchifera.
Class III Pteropoda	" VI Tunieata

Sub-Kingdom III, ARTICULATA

Class 1 Insecta	Class IV Cirripeda.
" II Arachnida,	" V Annelata
" III Crustacea	" VI Entozoa

Sub-Kingdom IV, RADIATA

Class 1 Acalepha	Cl IV Foraminifera.
" II Echinoder-	Cl V Infusoria
mata	
Class III Zoophyta	" VI. Amorphozoa

The four different types upon which all known animals are constituted constitute as many natural divisions or sub-kingdoms The first of these primary groups is characterized by an internal skeleton of which the essential or ever present part is a backbone, composed of numerous joints or vertebrae These are the beasts, birds, reptiles and fishes, and are known as the vertebrata or vertebrated animals, meaning animals with a backbone

The second type is the mollusca or soft bodied animals Insects, spiders, crabs and worms whose bodies have many joints or articulations, called the Articulata form the third sub-kingdom, and the fourth is the star-fishes, sea jellies, coral animals and the countless microscopic creatures which

MOLLUSCA.

swarm in the waters The mollusca are related to the zoophytes by the affinity of their simpler forms, and the higher classes of them to the fishes So far as geological researches have gone, the four leading types of animal structure have existed simultaneously from the very beginning of life on the globe, and though perpetually varying in the form under which they were manifested they have never since entirely ceased to exist Mr S P Woodward arranges the mollusca as under

CLASS I CEPHALOPODA. CEPHALOPODS

There appear amongst them many specimens of the ordinary *Placuna* placenta and other recent shells which would indicate their age to be that of Professor Lyell's postphocene series in his post tertiary group P placenta does not now occur in any part of the seas near the Western Peninsula of India but is still found near Singapore

The truncated molluscs are not known to be of any direct use to man, but they are interesting to the physiologist from the fact that they secrete a woody substance for their shells. So long as naturalists classified the mollusca, by the appearance of their shells, this branch of natural history was known as conchology, and two great divisions were the bivalve and univalve shells, *Brachiopoda* and *Lamelli-branchiata* shells, *Gasteropoda*, *Pteropoda* and *Cephalopoda*

All shells consist of two layers, an upper or outer which is rough, and more or less developed and an inner layer, called nacre, which is smooth. The nacre consists of a series of delicate layers one over the other in an imbricated manner with their edges presenting a series of lines with waved edges. The brilliancy of the colours reflected from this iridescent surface depends on the thinness of the laminae or layers of the nacre, where the layers are thick, like those in the oyster, only a dull white appearance is presented, but, as in the ear-shell and mother of pearl shell, the iridescent colours reflected from the thin layers are beautiful, they are used for the ornamentation of papier-mache work and for other ornamental purposes. As seen in cabinets, the outer rough layer is always removed and the hard layer below polished. The beautiful pearl, so largely used for ornament, the name of which is synonymous with purity, is the produce of various species of molluscs. The nacre is secreted by a part of the mollusc known as the mantle, and a pearl is the result of the nacreous matter being secreted by the mantle around some nucleus lying loose in the body of the shell, gene-

rally a grain of sand or some loose particle of naere. The largest pearls are obtained near Ceylon, in the Persian Gulf, and on the coast of Arabia, from the pearl oyster, the *Avicula margaritifera* in eastern seas, and the *Umo margaritifera* of Britain. The shells are opened and the pearls picked out and the shells are used for their naere which is called mother o' pearl almost as valuable as the pearl hemg, with that of the *Hahotis splendens*, extensively employed in ornamenting paper-mache work.

Cameo ornaments are obtained by carving shells they are used as brooches, pins, bracelets &c. and the most beautiful are cut on a large species of *Cassis*, (Cassa known as the Bull-month and found in the Mediterranean, but my shell can be made into a Cameo, the term meaning any small carving on a solid purpose. The window shell, *Placenta plicata*, is at present living in the China sea, but is found fossil, in great abundance, all round the coasts of India from Sind to Singapore and in the peninsula of India and China is largely used as a substitute for window glass. The mussel, the oyster, the whelk are largely used as food and the fibres of the *Pinna* shell, the substance by which molluscs attach themselves to rocks, is woven into a cloth. The great *Tridacna* shell, *T. gigas*, found in the Archipelago and S. Pacific ocean is improved to behold,—a pair of them weighing lbs 500 and the animal within lbs 20. The cowrie shell, *Cypræa moneta*, is largely used as a money in Africa Arabia the South of Persia, British India and the Archipelago, and also used to ornament saddlery and harness. The famous Tyrian purple is said to have been obtained from a whelk on the shores of the Mediterranean. The chank shell of the Indian ocean and Bay of Bengal, *Turbinella pyrum*, was long the war trumpet of the Hindoo races, is seen represented in the hand of their deity, Vishnu and other of their gods, is still used as a trumpet and is cut into anklets and anklets, often of several hundred rupees of value. More than 300,000 of these shells are annually exported from Ceylon. The veneration paid all over India to the huge chanks, especially those with the spiral line and mouth turned to the left, is great and reminds us of the music of Triton. They are cut into necklaces called *Kiantha* and are used for beetling fine cloths. Other shells, species of the genera *Trochus* and *Phasianella* are used as beads. The beautiful paper *Nautilus*, *Argonauta argo*, is admired by all who see it for its graceful form, delicate structure and pure colour. The cuttle fish, of the genera *Loligo* and *Sepia*, has

no outer shell, but instead, it carries in the skin of its back a hard oval mass called cuttle fish bone which, throughout the E. Indies, is largely used by painters as a polishing material. The cuttle fish has also a pouch or bag, which is filled with a dark coloured substance, hence called the ink bag, the liquid is poured out and manufactured into the dark pigment used by artists under the name of *Sepia*. Besides the whelks, the oysters, and the mussel scallop, *Pecten maximus* are served up broiled, also the razor fish, (*Solen maximus*), the cockle (*Cardium edule*) the limpet (*patella vulgaris*) the jelly fish, the cuttle fish are all eaten.

Dr William Thall writes regarding the shells of Singapore that they are found in the sea, in fresh water, and on the land, that the sea shells are most numerous, the fresh water shells are few, is there are no natural sheets of water. A considerable number which are commonly described as inhabiting fresh, are found there in brackish water, and several of them in places that are overflowed by the sea at high tides, indeed the only kind found exclusively in fresh water is a species of *Planorbis*. The land shells of Singapore are not more than 23 species. Several kinds of *Helix* and *Cyclostoma* appear to inhabit the depths of the forest, from whence it is almost impossible to procure them, the jungle being, for the most part, guarded by an interwoven mass of birchwood and prickly shrubs, several species have been discovered, only after the ground has been cleared by burning the trees and thus disclosing the half calcined remains of the shells. There is a remarkable paucity of the larger and more gaily coloured shells, though the coast is extensive and varied and is, apparently well adapted to the habits of life of molluscous animals, there are numerous sheltered bays and inlets, with large tracts of level sand, and in other places, shelving rocks clothed in part with a variety of *Algæ*, there are no rocks of a calcareous nature in that neighbourhood and it is difficult to account for the immense extent and rapid growth of the corallines which line the coast for many miles and in the elegance of their forms and variety of their species, almost vie with the land forests. This description of animal vegetation, if it may be so called, appears also to obtain its nourishment by absorption from the sea water. The poor Malays and Chinese use most kinds of shell fish as food, and search the shores for them with such diligence, that they have caused a dearth of such as are common in less frequented parts of the coast. Among the group of small islands 30 or 40 miles south of Sin-

gapore, where a human habitation is rarely seen, the general character of the shells is similar to those of Singapore, but they are more abundant and of larger size, particularly the genera *Hippopus*, *Tridacna*, *Spondylus* and *Chama*, which, especially the two latter, are much used as food by the natives. The *Voluta undulata*, the inhabitant of which is spotted with blotches of bright red on a dark ground, readily catches the eye at a distance of some yards, as it moves like a huge snail through the coral foliage, the *Voluta melo* also inhabits these seas, inferior to the former in the markings of the animal, but more than equal to it in the rich tints of the shells. Numerous molluscs cover the rocks or are firmly attached to branches of coral, in particular a species of *Chama* fantastically branched like coral, and in the brilliancy of its yellow colour more resembling a flower than a shell. In several of the shallow bays, are an abundance of a small species of *Meleagrina* or Mother of Pearl Oyster, few larger than the palm of the hand, and of a dark slate colour. Those accustomed to trade in Mother of Pearl, say that this kind never attains a large size. He was at first inclined to doubt the accuracy of the statement, as not more than two described species, namely, the *M. margaritifera*, and *M. albina* are to be found there. Among the shells of these latitudes, in common with those of all tropical climates, it is rare to find a single species that is identical with any found in the north of Europe, and it is observable that the few such shells, that are found native there, are not of the more common kinds. Of the species found in both latitudes may be mentioned *Chiton marginatus*, *Emarginula fissura*, *Fissurella graeca*, *Area tetragona*, *Natica castanea*, and a species closely resembling *Trivia europæa*. The poorer natives have frequent recourse to shell fish as food, a few kinds however are esteemed delicacies and are frequently exposed for sale in the market, of these may be enumerated *Area granosa*, (the shell of which somewhat resembles the common cockle) *Corbicula regia* or *Cyrena* of Lamarck, *Cerithium lineolatum* of Gray, and *Voluta melo*, though the latter is not always procurable. Among the eatable molluscs the oyster must not be omitted, though it is for the most part lightly esteemed by the natives, who generally prefer such kinds as have stronger taste. A variety of oysters may be found here but all are not eatable, two species in particular are of considerable size, and excellent flavour, though found in very different localities. The one kind is

abundant at Pedio Branca, a large rock at the entrance to the China Seas, where they are exposed to rapid currents and stormy waves, here they are invariably found strongly adherent to the rock by the surface of the lower valve. The other kind is procured from the mouth of the Moa river, between Malacca and Singapore. These being comparatively safe from the effects of storms and currents are never fixed to rocks but lie loose in the mud, in beds of considerable extent. Although oysters are so numerous in both these places, it is rare to find any other species of shell in their immediate vicinity, a circumstance that has been remarked of oyster beds in England and other places. Many of a species of *Nassa* are common there, found in the mud of salt swamps. It is in colour a dark brown or black, about an inch and a half in length, the outer whorl is smooth, those next the apex of the spine are furrowed longitudinally, and it possesses the usual generic mark of a prominent plate at the upper part of the aperture. In the same localities may be found another shell quite similar to the other in form and colour but not more than half its length, possessing however all the marks of a full grown shell, and as no shells of intermediate size are to be met with, there seems good reason to believe them two distinct species. At Malacca is a species of *Nassa* of a pale flesh colour banded with brown about a third of an inch in length, and little more than a grain in weight. In the same neighbourhood he met with another specimen, three quarters of an inch in length, and weighing between four and five grains. As in the former case, the two shells were exactly similar in shape and colour, though very different in size and weight. Several kinds of *Nassa* are particularly abundant in the neighbourhood of the fish markets, where they may be seen in numbers feeding on dead fish and other animal food. This artificial mode of subsistence is possibly one cause of their variable form and size, as it is well known that domestic animals, and others that are more or less dependent on man for their support, are very apt to produce a progeny differing more or less from the parent stock. In the neighbourhood of fish markets may also be seen multitudes of dead shells of all sizes, some so minute as to be microscopic, and all tenanted by Pagan or Hermit crabs, as varied in size as the shells they inhabit, and, like the *Nassa*, busily engaged in devouring fragments of dead fish, which is their principal food. The island of Singapore consists of

a cluster of low undulating hills based on an extensive plain having a uniform level surface, in some places not varying above two or three feet, in an area of several square miles. The whole of this valley ground is but little raised above the level of the sea, as is shown by the salt water penetrating for miles into the interior of the island, and in spring tides, even overflowing cultivated fields. Over some parts of this low ground there is a layer of decomposed vegetable matter of variable depth, but for the most part the surface is sand, beneath which, at depths varying from 5 to 50 feet, there is a dark blue plastic clay abounding in shells, and these not of the kinds found in mangrove swamps, but such as are common in open sandy bays or straits. They are not different from those found in the adjacent seas, the forms of most of them are perfect, and in a few the colour is preserved, but they have for the most part lost their hardness, being readily crushed between the fingers. The kinds most abundant are *Placenta plicata*, *Strombus incisus*, *S. labiosus*, several species of *Nassa*, *Columbella*, *Trochus*, *Cerithium*, *Mitra*, *Turritella*, *Dentalium*, *Aspergillum*, *Arica*, *Venus*, *Corbula*, *Tellina* and others. Wherever excavations are made in the low ground of Singapore, similar appearances present themselves in all the brick pits the clay is of the same description and also contains shells, in the Kallang valley, corals similar to existing species are to be found at the depth of six feet, add to this the fact that the growth of coral is early diminishing the depth of water in the neighbourhood, a good example of which is seen at the entrance to New Harbour where there is a small peaked island, between which and Singapore the coral has grown so rapidly that it is thought the island will in a very few years form a part of Singapore, taking therefore all these circumstances into consideration the existence of shells in such situation may be rationally accounted for on the supposition that most of the valley ground of Singapore was originally sea, and has been altered and adapted to the use of man, chiefly, if not solely through the agency of coral. The *Magilus antiquus* has lately been found north of Penang in the neighbourhood of Junk Ceylon, the natives set some value on them, and occasionally wear them as ornaments, the shell is singular and apt to be mistaken for a petrification, being dense in structure, diaphanous, and much like alabaster. It has been often figured and described by naturalists, but the animal inhabiting it is supposed to be a Gas-

teropod, though this is rather doubtful, as the shell is said to be generally found imbedded in coral or madiepoie. Among other interesting discoveries lately made on that part of the coast, is a layer or stratum of grey limestone, of considerable extent, composed almost entirely of petrified shells. One specimen contains three distinct species, apparently fresh. Of the numerous class of shells inhabiting the interior of madiepoies, wood, and stone, there is a species allied to '*Pholas*' which seems to answer the description of the genus *Jonnannetia* of M. DesMoulins in a work entitled '*Manuel des Mollusques par M. Lander Range*' the shell is white, rather less than a musket ball, and nearly as globular in form, with a slight caudiform appendage at one end, situated obliquely and having accessory pieces, the consistence of the shell more resembles that of the bivalve of the '*Teredo*' than a *Pholas* and M. DesMoulins considers it to hold a place between these two genera. The specimens met with were in the interior of rolled masses of '*madiepoie*' and were evidently old, and none contained the animal alive or dead. The '*Lima*' or the '*file shell*' of which several species are found in the Straits, much resembles the genus '*Pecten*' or '*scallop shell*' which is well known to possess greater power of locomotion than most bivalves. This power is possessed even in a greater degree by the *Lima*. When in the water its movements are graceful, the two valves being used as fins by means of which it swims with considerable rapidity guiding itself by its numerous tentacula which are frequently of an orange colour and arranged not unlike the petals of a flower, the shell is less curved than the scallop, and generally white, the valves do not entirely close.

The *Parmaphora* or *Ducksbill Limpet* is found there, though by no means a common shell, it is like a *Patella* flattened and elongated, the anterior edge always widely notched, apex slightly recurved, length from one to two inches, colour white, the body of the animal is much more bulky than the shell, and the mantle is so capacious that it covers the whole shell except the apex, which enables it in some degree to elude search, as it appears more like a pulpy or spongy mass than a shell, when touched, the mantle stains the hand a dark purple colour.

A species of *Planorbis* or shell allied to *Planorbis* is found there in pools of fresh water, being the only species of Singapore shell that is found solely in fresh water, the outer whorl is little more than a quarter

of an inch in diameter, the aperture of the shell more diagonal than is usual in Planorbis so that when the animal moves on a plain surface the convex side of the shell is always uppermost whereas the animal of Planorbis is described as carrying its shell erect or with the diameter perpendicular, colour of shell pale amber, no operculum, animal nearly black, mouth vertically cleft, no perceptible neck (in the animal of Planorbis, the neck is said to be elongated) eyes at the base of two blunt tentacula in which also it differs from Planorbis which is commonly described and figured as having two subulate tentacula the animal possesses in a considerable degree, the power of gliding through the water, apparently in search of food, with its shell entirely submerged and its smooth foot in close opposition with the surface of the water, locomotion being effected, by causing the flat part of the shell to act on the water in the manner of a fin, the head of the animal being at the same time, directed forward so as to regulate its movements, the animal does not occupy so much as half the shell, and the remaining space frequently contains air, which the inhabitant has the power of expelling at pleasure.

Of the genus "Natica" there are several elegant species in Singapore, it is known from the "Nerita" or "hoof shell" by being umbilicated, more rounded in form, and the interior not toothed, the shell has been also described as having no epidermis, to this rule however, there are marked exceptions, two of the species native there, having a strongly adherent epidermis.

In Swanson's Malachology a species is figured as an extraordinary animal, much larger than the shell it is supposed to inhabit, one of the species found here presents the same appearance in a remarkable degree, and the cause of the phenomenon is that the interior of the foot of the animal is a loose cellular texture, which it has the power of distending with water so as to be more than three times the bulk of the shell, but on the approach of danger it can instantly reject the water, resume its natural size, and retreat into its shell closing after it the operculum which being of stony hardness, secures it from the attack of ordinary foes. This mechanism doubtless assists the progress of the animal through sand in which it frequently burrows.

There are two shells of the genus *Cerithium*. In *C. lineolatum* the shell is about an inch and a half in length, thin and fragile, of a brown colour, with obscure transverse bands of a lighter hue, aper-

ture more rounded than is usual in the genus *Cerithium*, spine always truncated in the full grown shell, head and anterior part of the animal bright red like coral the other species observed in Singapore, has rather a larger shell, thinner and more fragile than the other and of a darker colour, the animal is brown or nearly black and like the former, the spine of the full grown shell is always decollated, young specimens of the shell have perfect, sharp pointed spines, and the convoluted extremity of the animal then entirely fills the spiral part of the shell, but as the animal increases in size, its posterior extremity becomes more blunted and gradually retreats towards the anterior part of the shell, and as it successively abandons each turn of the spine, it throws out a viscid secretion which forms a hard shelly partition between its new situation and the disused extremity of the spine, which being deprived of its usual nourishment, soon becomes worn into holes and finally drops off thus the shell when arrived at maturity has always the appearance of being imperfect. The habits of the animal are mixed and peculiar, sometimes it may be seen in a half torpid state, the operculum firmly closed suspended by a glistening thread, from the branch of a tree, when in motion it leaves behind it a shining track like that of a snail, at the sides of an elongated proboscis are two tentacula, apparently short, blunt, and with eyes at their extremities as the genus *Cerithium* is described as having the eyes at the base of the tentacula, this would appear a very remarkable deviation and Dr. Traill was disposed to consider it as such until he had an opportunity of remarking the movements of the animal in water, where it is as often found as on land. When closely observed in that element, it is seen to expand two slender, pointed, tentacula of so delicate a structure that when out of the water they are lax, flaccid, and doubled under the protuberant eye, so as to be almost invisible. The shell has been found in running streams but more commonly in the blackish water of canals or ditches.

Of the very numerous species of the genus *Cypria*, or Cowry shell, the largest found here is the "*Cypria tigris*" which is prettily spotted with black, it is frequently made into snuff boxes in England. The mantle is so large as to cover all the shell, on the back of which there is often a longitudinal line which marks where its two folds meet this membrane continually secretes an abundance of viscid fluid which lubricates the shell, and preserves the beautiful polish which has procured for them the name of porcelain shells.

"*Cypicea olivacea*" is the most abundant of the Singapore cowries being found on most beaches under flat stones, it is of the size and much the colour of an olive except that the back is generally mottled with brown and the mouth somewhat yellow, the specimen which he found with the young attached, was fixed in the usual manner, to the lower surface of a stone, on raising it there was found adhering to it, a flat circular membrane broader than the shell, transparent, and dotted with minute grey spots like grains of sand, on placing the mollusc in a glass of sea water, numbers of grains dropped out of the membranous mass to the bottom of the glass and immediately assumed rapid and lively movements, some revolving in a rotatory manner, others alternately rising and sinking in the water or sporting over its surface. On a closer examination these grains were seen to be in reality shells, some hundreds in number, nearly transparent, having no perceptible columella and apparently consisting of a single coil or whorl, aperture round, breadth of the shell greater than the length, so that, when on a plain surface it rested on either end like a *Planorbis* or *Nautilus*, the animal effected these rapid movements by the alternate contraction and expansion of its foot which was broad and expanded and much larger than the shell, into which it seemed to have no power of withdrawing it.

Another cowry is occasionally found on the coast, resembling in colour the *C. adusta*, but not more than half the size and less cylindrical in shape. One was fished up in "ten fathom" water near Sultan's Shoal to the westward of Singapore, partially imbedded in a species of sponge, on detaching it from which, the cavity of the spongy mass was found lined with the young fry of the *Cypicea*, differing however in several respects from that of the *C. olivacea*,—instead of being contained in one membranaceous envelope there were about two hundred transparent sacs not larger than grains of mustard seed and each containing about 30 shells so minute that they could not be distinguished without the aid of a microscope, at a moderate computation there could not have been less than six thousand young shells the difference in size is remarkable, as the *Cypicea olivacea* which had the largest offspring is a much smaller shell than the one at present under consideration, the animals were dead, having been many hours out of the water, when examined under a microscope the shape of the shell was found to resemble exactly that of the young *C. olivacea* above described.

On various parts of the coast, particularly on coral banks, a considerable number of *Echini* may be observed, which (although Naturalists have separated them from the testaceous mollusca) it may not be out of place to mention, in one species not hitherto described the shell is spheroidal, flattened, not more than two inches in diameter and of a dark purple colour, the species are numerous, six or eight inches long, black, very slender and sharp pointed and somewhat elastic, the animal is found along the edges of coral reefs, and moves with tolerable rapidity by means of its spines, when closely pursued it has the faculty of darting itself forward against its opponent and thereby inflicting considerable injury with its sharp spines, the points of which often break off and remain in the wound.

The poor of India use as food *Cyclas*, *Cerithium*, two species; *Nerita*, *Corbicula*, one species found within tidal influence, and two others in fresh water.

Velorita cypinoides (Gray) of the family *Cyrenidæ*. *Unio* *Lamnea stagnalis* *Ampullaria glauca* *L. Planorbis Indicus* *P. Coromandelina* *Paludina bengalensis*.

Bornella digitata Adams, is a nudibranch or marine slug, which occurs in the tropical seas in the south of Asia at Aden, in the Straits of Sunda, and on the Madras coast. It has brilliant colours, with vermilion streaks and is delicately marbled and has waving elegant tufts. It swims by a lateral movement of the body.

Amussium Japonicum is a large scallop of Japan. The Japanese call it *Tsuki-hi-kai* and the Sun and Moon shell, from its presenting a yellow disc on one side and a white one on the other.—*Bulwer, Catalogue of the Government Central Museum Madras*, Dr. *Laurester uses of animals*, Dr. *Thaill in Journal Indian Archipelago*, Woodward, *Recent and Fossil shells*, Dr. *Cuthbert Collingwood*, *M A M B, Rambles of a Naturalist*, London, 1868.

MOLOCH, a name of Baal. See Infanticide Sacrifice.

MOLOSSUS CHEIROPUS. See Chiroptera.

MOLOSSUS TIBETANUS, The Tibetan mastiffs, fierce-looking animals.

MOLUCCAS, also styled the Spice Islands. The whole of the numerous islands between Celebes and Papua are geographically called the Moluccas, although politically this name is restricted to the Dutch Spice Islands, Banda, Amboyna, Coiam, Batchian, Tidore, and Ternate. The Moluccas, properly so called, form two groups, composed of numerous islands assigned by geography to the

fourth and fifth ranks, though in history they occupy, from their commercial and political importance, a place equally prominent with Java and Sumatra. Of them, as of the Philippines, it is to be observed, that their origin is volcanic. Although Ternate was in ancient times the capital of the Spice Group, Amboyna, or the Isle of Dew, is politically the chief, and has always been valued by the Dutch among the most important of their possessions, the crown and key of the Moluccas. It belongs in size to the fifth rank, although it has been assigned to the fourth. The area of the island is calculated at little more than thirteen geographical leagues, its population at nearly fifty thousand. Viewed from the sea Amboyna presents its elevated surface to the eye, diversified by many varieties of outline. The nutmeg, produced in perfection nowhere in the world out of this, the third division of the Indian Archipelago, is found, but it is for the clove that the island is celebrated, and that rich possession has been to it a curse, as the gold of Mexico and Peru was to the original tenants of those countries. It brought upon the people cruel and selfish masters, who drenched the soil in blood that the natives might be forced to lend their labour to the service of a monopoly, first claimed by the Portuguese but followed by the Dutch. About three hundred thousand pounds are annually produced. The culture and collection of the spice employs almost all the population, and exhibits a curious social picture, from the planting of the young trees to the drying and packing rooms, in which, according to a credulous and quaint cosmographer of the sixteenth century, a pail of water would dry up in two days, from the excessive heat of the cloves.

In the Moluccas are three large islands, Gilolo, Ceram and Bouru, with many small isles and islets, Batchian, Moty, Obi, Ke, Timor-laut, Amboyna, Ternate, Tidore, Kaia and Banda. The Moluccas include five islands off the W coast of Gilolo, and Bouru, Amboyna, and other islands are off the S coast of Ceram. The three large islands are Gilolo, Ceram and Bouru with a great number of smaller ones, amongst others Batchian, Moty, Obi, Ke, Timor—Laut, Amboyna, Ternate, Tidore, Kaia and Banda. These occupy a space of ten degrees of latitude by eight of longitude, and by groups of small islands they are connected to N Guinea on the East, the Philippines on the North, Celebes on the West and Timor on the South. The land mammals are few in number. There are 25 bats but only 10 land mammals are known in

the group, amongst them *Cynopithecus nigrescens*, *Viverra zangalunga*, *Rusa hippelaphus*, var the Babuissa, *Soerex myosurus*, common to Sumatra, Borneo and Java, and four marsupials, viz, the small flying opossum, *Belides ariel*, a beautiful little animal resembling the flying squirrel in appearance and three species of *Cuscus*, peculiar to the Austro-Malayan region,—opossum like animals with a long prehensile tail, of which the terminal half is generally bare, they have small heads, large eyes, and a dense covering of woolly fur, often pure white with irregular black spots or blotches, but sometimes ashly brown, their flesh is everywhere eaten. They live in flocks and feed on the leaves, of which they devour large quantities, they are very tenacious of life. There are, however, 265 species of birds known amongst them, the large red crested cockatoo, two species of the *Eclectus* parrot, and five of the beautiful crimson lories, 21 species of pigeons, 16 species of kingfishers and the mound making *Megapodius*. Wallace inhabits Gilolo Ternate and Bouru. The Moluccas or Spice islands, next to Java, are the most important of the Dutch possessions in India. The islands Amboyna, Banda, Ternate, Tidore and the smaller islands in the neighbourhood, form a sub-government of Java. The greatest part of these islands were discovered by the Portuguese who were in possession of them at the commencement of the 16th century, but they were taken by the Dutch at the close of that era. The monstrous policy of this nation led them, at one time, to root up and destroy, at a great cost, often by force of arms, all nutmeg and clove trees except the number necessary to produce the quantity of spices which it could sell, and so preserve the monopoly. The islands are small, volcanic, unproductive in grain, but fertile in fine spices.

Rosigain, near Banda, was almost abandoned after the extirpation of its spice trees, its people emigrating to the neighbouring islands in search of a livelihood. The people are of the Malayan race, short, squat, and darker in complexion than the Malays or Javanese.

The Amboinnes are of a middling height and well formed. They make good mounted and foot soldiers. They are gentle, brave, very sober and easily managed. A considerable number have embraced Christianity. Their costume is nearly the same as the Malays of Java. The average annual crop of cloves is from 250,000 to 300,000 lbs. The clove tree begins to bear at 15 years and is in full perfection at 20, and the average yield is 5 lbs, though a tree has been

known to yield 25 lbs. It attains a height of 35 to 40 feet.

Banda residency comprises several islands, of which are Banda or Banda Neera, Gunong Api, so named from its terrible volcano, Lonthor, Rosingam almost abandoned after the extirpation of its spices, Pulu-Ai, and Pinang. Banda is very unhealthy and is subject to frightful earthquakes many of the people are christians. When first discovered by Europeans, the inhabitants had made considerable advance in civilization, but one still much inferior to that of the Malays and Javanese. Sir Stamford Raffles has furnished specimens of three of the languages of this furthest group of islands. The Banda cluster are the most southern of the Spice Islands, and are twelve in number, each only a few miles in extent and all lying near each other. These are lofty volcanic isles, one of them constantly vomiting forth smoke or flame, and all possessing a rich black soil, luxuriantly clothed with trees, chiefly the nutmeg tree which resembles a large pear tree but with a laurel-shaped leaf.

The crescent shaped island of Lontar is the largest.

The area of the whole group is only 176 geographical square miles, but in five of them, nearly all the nutmegs consumed in the world are grown, and for the last 20 years they have annually yielded lbs 583,000 of nutmeg and lbs 137,000 of mace, Dutch weight.

The islands are high, liable to sudden gusts of wind. There is an anchorage in lat $4^{\circ} 31'$ S and long $130^{\circ} 0'$ E at the foot of Gunong Api.

Amongst the Molucca islands, Banda is the chief nutmeg group. The nutmeg with the equally prized mace, the excellent maritime position, the superb roadstead, and the fertile soil of Banda, render it conspicuous among the Spice Islands. But, unlike Ambuyna it is unhealthy, and exposed to constant danger from the Gunong Api volcano, which has many times burst in magnificent eruption, devastating the neighbouring region, and blasting it with showers of scorching ashes. The three islands, Banda Neera, Nuthor, and Gunong Api, form a roadstead sheltered from every wind, but the Gunong Api, or Fire Mountain, is the cause of the group, not only when in eruption, but on account of the insalubrity it spreads around. The base of this volcano, called by the French the Grenade of Banda, occupies the whole surface of the islet to which it gives a name. Its height is about 2,000 feet, covered with magnificent vegetation, commenc-

ing at the line where the waves cease to beat, and continuing upwards to the point where the lava ceases to flow, on being cooled by the air.

But the nutmeg is not cultivated on Gunong Api and the isle is inhabited only by a few emigrants from Timor.

Gilolo, is one of the Molucca Islands. Its north end is in about lat $2^{\circ} 23'$ N. It has a long mountainous coast, high bold land, with three remarkable peaks. The indigenes live in the north of the island. They are radically distinct from all the Malay race. Their stature, then features, as well as their dispositions and habits are almost the same as those of the Papuan. Their hair is semi-Papuan, neither straight, smooth and glossy like all true Malays, nor so frizzly and woolly as the perfect Papuan type, but always crisp, waved and rough, such as often occurs among the true Papuans but never among the Malays. Their colour alone is often exactly that of the Malay, or even lighter. Of course there has been intermixture and individuals are occasionally seen whom it is difficult to classify, but in most cases, the large, somewhat aquiline, nose with elongated apex, the tall stature, the waved hair, bearded face, and hairy body, as well as the less reserved manner and louder voice unmistakably proclaim the Papuan type. Here is the exact boundary between the Malay and Papuan race. It is only in the northern peninsula that these Papuan indigenes exist, the whole of the rest of the island with Batchuan and the other islands westward being exclusively inhabited by Malay tribes like those of Ternate and Tidore. This would seem to indicate that the Alfura are a comparatively recent immigration and that they have come from the north or east, perhaps from some of the islands of the Pacific, though it is difficult to understand why so many fertile islands should possess no indigenes. The Galela race are natives of a district in the extreme north of Gilolo, but they are great wanderers over the Archipelago. They are a very fine race, remarkably energetic and industrious, of light complexion, tall and with Papuan features, coming near to the drawings and descriptions of the true Polynesians of Tahiti and Owyhee. They build large and roomy pahu with outriggers, and settle on any coast or island they take a fancy for. They catch turtle and tupang, hunt deer and wild pigs and dry the meat, and cut down the forest and plant rice or maize. The people of Gilolo are called Alfura, and Professor Bikmore, however, states they are strictly of the Malay type, and have not the dark skin and frizzly hair of the Alfura of Ceram and

Buru, though representatives of that people may exist in Gilolo. The population of Gilolo are supposed to be 75,000 all but 5,000 of whom are under the sultan of Ternate.

The clove tree grows spontaneously on Ternate, Tidore, Motu, Makian, and Bachian. The northern peninsula of Gilolo, and the great island of Ceram is inhabited by the Alfuros of Sahoe and Galela. These people are quite distinct from the Malays and almost equally so from the Papuans. They are tall and well made, with Papuan features and curly hair. They are bearded and hairy limbed, but they are quite as light in colour as the Malays. They are an industrious and enterprising race. Cultivating rice and vegetables and indefatigable in their search after game, fish, tipang, pearls, and tortoise shell.

Tidore, on the west coast of Gilolo, is about 6 miles long. A mountain on the N E end of the island, is in lat $0^{\circ} 40'$ N long, $127^{\circ} 22\frac{1}{2}'$ E. Tidore is over 4000 feet high. Tidore, like Ternate,—from which it is two or three leagues distant—is formed in its southern part of lofty hills. The soil is of great fecundity, and plentifully watered by streams from the peaks. The people appreciate these blessings, and labour more earnestly on the land than those of the sister isle, distinguishing themselves by an aptitude for agricultural occupation. Near is Batchian, the largest of the chaplet of isles surrounding Gilolo, fertile as Tidore, but neglected and rotting in its wealth and beauty, under the hands of a population universally indolent. The soil is volcanic, and below the active crater springs of sulphureous water break from the ground in the most picturesque situations. Among the people here, as in Amboyna, the christian converts are the most inert and servile. The situation and aspect of the island are beautiful, its fertility is abundant, its climate leaves little to desire, yet is all but a waste, with a scant and scattered population immersed in poverty. Monkeys are to be found nowhere else in the Molucca Archipelago. The Molucca sea is sprinkled with smaller islands interesting and curious in themselves, but too little important, and too numerous to be separately noticed. Among them, however, may be enumerated Tawali, Mandola, Lutta, Hanika, Saparua, Ghissa, the Keffing Isles, Amblow, Mamfia, Kilang, Bono, Haelecoe, Hominoa, Noesa Lant, Hila, Kiluan, Binoia, Nelany, Manipa, Manok, Myo, Tesory, Serua, Motu, Bally, Tomoguy, Selang, Gag, and Battang Pally. There is considerable variety in their aspect, form, and size. Some, like Battang Pally, are not half a mile round, though

bearing a grove of trees. Others, considerably larger, are of moderate elevation, and wooded over their whole extent. Pulo Gag, unlike most of its companions, presents an English appearance, being luxuriantly fertile, but with the exception of a few tall timber clumps, entirely bare of trees. Many are wholly uninhabited. The greater and the lesser Keffing, however, now little known islets, S E of Ceram, are well peopled by mohammedan Malays, and sprinkled with houses of traders engaged in traffic with the Nassau, the Ki, and the Temember Isles, where they sell the produce of their fishery, tortoise, and tipang. The isles are low, but remarkably picturesque.

Bouo island is one of the Moluccas, Fort Defence, being in Lat $3^{\circ} 22\frac{1}{2}'$ S Long $127^{\circ} 4'$ E in Lat $3^{\circ} 6'$ S Long $125^{\circ} 57'$ E is about two hundred miles in circumference. The island is high and has a semi-circular mountain on its N W part. Bouo has two races, the larger number are Malays of the Celebes type, often exactly similar to the Tomore people of East Celebes, who are settled in Batchian, but the other race resemble the Alfura of Ceram. The bulk of the inhabitants are a comparatively few people, very closely resembling the native of Amboyna.

The cluster of islets lying at the South-east extremity of the large island of Seran as it is called by the natives, or Ceram as it is laid down in the maps are known as Ceram. They are situated in latitude $30^{\circ} 55'$ south, and in L 133° E and form one of the most remote trading stations to the eastward, from which the produce of the Archipelago is conveyed in native vessels to this port. The Island of Ceram is the second in size of the Moluccas, having an estimated area of about 10,000 square miles. The mountains are from six to eight thousand feet in height, sending down innumerable streams to the sea. The vegetation is every where luxuriant, and the trees gigantic. Admiral Keppel had in his possession a circular slab of wood from the island, three and a half inch thick, eight and a half in diameter. The sago palm in particular is more abundant and productive, than on any of the adjoining islands. Cloves and nutmegs grow wild. The names of the several islets which compose the Ceram group are Seranreh, Gesir, Kaliwaroo, Gorong, Manokoo, and Malomgee. Of these, the two largest are Gorong and Manakoo, and are the only ones of the group which exhibit any appearance of fertility. They are represented to be hilly and covered with wood, except where cleared for the purpose of cultivation, which however seems confined to the little

rice which is grown on them. They produce fruit trees in considerable abundance, and among them the durian and mungosteen, as also the wild nutmeg, the cocoanut and sago palm, the latter supplying to the natives the chief article of subsistence. Ceram has on its western side the three islands Bonoa, Kelang and Manipa. The commercial products from these islands consist of tortoise-shell, mother o'pearl shell, beche de mer, wild cinnamon, wild nutmegs, and birds of paradise.

Ceram is the largest island of the Moluccas, and next to Celebes, of all its Archipelago. It is 162 miles long, but its greatest breadth is only 42 miles. The island is one long mountain chain that sets off transverse spurs, and some of the peaks are 5,000 or 6,000 feet in height. The people of Ceram approach nearer to the Papuan type than those of Gilolo. They are darker in colour, and a number of them have the frizzly Papuan hair, their features are harsh and prominent, and the women are far less engaging than those of the Malay race. The Papua or Alfuro man of Ceram gathers his frizzly hair into a flat circular knot over the left temple, and places cylinders of wood, as thick as one's fingers and coloured red at the ends in the lobes of the ears. They are very nearly in a state of nature, and go almost naked, but amulets and anklets of woven grass or of silver, with necklaces of beads of small fruits, complete their attire. The women have similar ornaments, but wear their hair loose. All are tall, with a dark brown skin, and well marked Papuan physiognomy. The Alfuro or Papuan race are the predominant type in the island of Ceram. Of twenty-eight words of the language of Ceram, nine of the words are Malay, two Javanese, and seventeen are common to these two languages. The natives themselves, however, of the Ceram Laut islands have never visited this port, the trade to it from thence being exclusively carried on by the Bugis, the Phœnicians of the Eastern Archipelago, of whom a few are settled on the island, while others resort there as a trading station.

Ceram is about 185 miles long by about 30, broad and is traversed from east to west by a mountain range.

Batehan is about 52 miles long by 20, and is separated from Gilolo only by a narrow strait.

Tidore and Ternate are two small isles, each dominated by a cloud-capped peak.

Amboyna is about 32 miles long by 10 in breadth, and its volcanic soil is so rich in the finer woods, that a Dutch botanist presented to a duke of Tuscany a cabinet inlaid

with 100 specimens, all of which he had obtained in the island. The most distinguished of these is the clove, about the size of the nutmeg tree.

Westward of the Moluccas is Celebes, an island resembling Gilolo in grotesqueness of form, about 500 miles in length by 100 in breadth. In Celebes, the Trans-Javan or Timorian band, and the Moluccas, is a large and important class of Indonesians, who graduate between the Anam type, the Burman and the Negrito. The most prevalent head or that of the predominant race is ovoid, but it is somewhat Burman in nose, eye and colour. The great island of Celebes may be considered the centre of a group of languages, which, although agreeing with those heretofore described in simplicity of grammatical structure, differs very widely from them in phonetic character although spoken by the same race of men. Celebes is intersected by the equator, leaving a small portion of it in the northern and the mass in the southern hemisphere. Its greatest length is about 500 miles, but its greatest breadth does not exceed 100, and in some places it is hardly one-third of this width. Celebes may be considered to be the focus of an original and independent civilization which probably sprung up amongst the most advanced of the nations which occupy it, called by themselves Wngi, and by the Malays, and after them by Europeans, Bugi or in the plural Bugis. In material civilization the Bugi are equal to the Malay. Of the language of Celebes, the next in importance to the Bugi, is the Macassar. The people who speak this tongue inhabit the same peninsula. They call themselves and their language Mankasara, and hence the Makassar or Mankasar, of the Malays, whence the European name Macassar. Besides Bugi and Macassar, the two principal languages, there are three other languages of Celebes written in the same character, or, at least, occasionally written in it, the Mandai, the Manado, and the Gorontalo. The Mandai is spoken by a people on that side of the South-western peninsula, which fronts Borneo.

The island of Sumbawa, the third in a direct line east of Java, about three times the extent of Bali or Lombok, and divided by a deep bay into two peninsulas, has three languages, the Sumbawa, the Bima, and the Tamboira. The natives of Sumbawa are little inferior in cultivation to the most improved nations of Celebes. The Sumbawa and Bima languages are written in the Bugi character, but there exists in this island a singular and curious obsolete alphabet. It is

ascribed to the Bima nation, but the characters do not generally correspond with the simple sounds of the Bima language as exhibited in the specimen given of it

The Moluccas exhibit a very singular feature in the exact conical form, with which most of them rise above the horizon to meet the navigator at the distance of 80 or 90 miles. In other cases he is glad to have the flying contour of a landscape to guide him in the recognition of the coast and headlands, but there is something so peculiar in the aspect of these islands, that he feels confident he never can mistake them. The extirpation by the Dutch of the spice trees in the Moluccas is no longer prosecuted, although its effects are of course still felt. The monopoly of the spices is continued, but the system now pursued is not so oppressive to the natives.

The Spice Islands in the Molucca and Banda seas, consist of many islands and numerous languages. Next to Java of which they form a sub-government, the Moluccas are the most important of the Dutch possessions in India. The chief islands to which this term is applied are Amboyna, Banda, Ternate, Tidore with smaller islands in their neighbourhood. The islands are small, volcanic, unproductive in grain, but fertile in fine spices. But the ruinous policy of the Dutch nation in their greed to secure a monopoly of this class of products, led them for years, to root up and destroy, at a great cost, often by force of arms, every nutmeg or clove tree not required for the production of that quantity of spices which they calculated they could dispose of. Rosangan, near Banda, was almost abandoned after the extirpation of its spice trees, its people emigrating to the neighbouring islands in search of a livelihood. The people are of the Malayan race, short, squab and darker in complexion than the Malays or Javanese. The Amboynese are of a middling height and well formed. They are gentle, very sober, brave, easily managed, and make good mounted and foot soldiers and a considerable number of them have embraced christianity. Banda is very unhealthy, and is subject to frightful earthquakes. When first discovered by Europeans, the inhabitants had made considerable advance in civilization, but one still much inferior to that of the Malays and Javanese. Sir Stamford Raffles has furnished specimens of three of the languages of this furthest east portion, viz those of Ceram, correctly Seang, of Ternate, correctly Tainath, and of Sapaiwa, one of the Banda isles. Of the language of Ceram, nine of the words are Malay, two Javanese, 17 are common to these two languages. Ceram Laut is the great place to which the Bugis carry

the Papuan slaves whom they steal from New Guinea

Timur is a word which means the east, and was probably imposed on this island by the Malays, to whose language it belongs, because this was the extreme limit of their ordinary commercial voyages to the south-east. Timur is about three times the extent of Jamaica. Its principal inhabitants are of the Malayan race, but it contains also Papuans or Negroes, and tribes of the intermediate race. The two languages of Timur are the Manatoto and the Timuri, the first spoken at the north-east end of the island, and the last used by many of the tribes as a common medium of intercourse. No alphabet has ever been invented in Timur, but judging by the specimens of its language, the vowels are the same as those of the Malay and Javanese.

From Timur to New Guinea, there runs a long chain of islets, forming, as it were, a wall of barrier to the south-eastern portion of the Archipelago. In these islets the inhabitants speak many languages. By far the most ample and authentic account of them has been given by Mr Winsor Earl, who says that in the south-eastern parts of the Indian Archipelago, where opportunities of social intercourse between the various petty tribes are of rare occurrence, every island, every detached group of villages, has its own peculiar dialect which is often unintelligible, even to the tribes in its immediate neighbourhood. In some of the larger islands, Timur, for example, these tribes are so numerous, and the country occupied by many of them so extensive, that it becomes impossible to form even an approximate estimate of their number. Of one language, the prevailing one among several languages of the island of Kisa, one of the Sarawati group in the chain of islets already mentioned, Mr Earl furnished a vocabulary of 330 words. The Kisa is an unwritten tongue, but its vowels are the same as those of the Malay and Javanese.—*St John's Indian Archipelago*, Vol I, p 121, 121, Vol III, p 220, *Angaisides, History of the Moluccas*, Temminck, *Possessions Néerlandaises dans l'Inde Archipelagique*, III, 219 Temminck, *Coup de Œil*, III, 219 I 3 F. Compact bitumen	"	" Panjabium	"
Jews pitch	"	" Selajit	"
Mineral "	"	Momai	PERS
Mithi	"	Asphalto	"
Asphtha	"		

The English and Portuguese name as-
 phalto is derived from the Lake Asphaltites,
 but the substance is now found in several
 countries

Bitumen is obtained from the Swiss fron-
 tier in France, from the Bitumen Lake
 in Trinidad It is found on the surface
 of volcanic productions, floats on the Asphal-
 tic Lake or Dead Sea in Syria, is also
 found near ancient Babylon, it is sup-
 posed that the cement used for the walls
 of that city as also for the temple of Solomon,
 was a preparation of asphalte, and Herodo-
 tus mentions that it was heated and mixed
 with reeds and so used, it is supposed
 also to be the substance translated in the
 Bible as pitch, and to have been used by
 Noah to coat or pay the ark and by the mo-
 ther of Moses to coat the vessel in which he
 was laid afloat, and it seems to be the sub-
 stance known in Central Asia and in the
 north of Persia under the name of Momiai
 Where damp has to be resisted, it is
 useful, it is found impervious to wet, white
 ants or vermin, and as it does not vegetate,

rot or decay, it is superior to wood, or mor-
 tai as a flooring material Dr Honigbeiger
 (p 238 and 239) says that the Persian
 Mumiai—is deemed a certain specific in
 fractured bones, deserving the name of
 osteocola It is a solid, hard, heavy, black,
 ghstening mass without any particular odour
 The genuine is but seldom to be met with,
 even in Persia itself, the place of its origin,
 for the king of Persia is reported to collect
 the whole product yearly and to inclose it in
 small silver boxes, which are distributed as
 presents to his family and friends In all
 Eastern bazaars may be found under the
 name of Persian Mumiai, a compound re-
 sembling the genuine in appearance Accord-
 ing to Dr Seligmann, Mum in Persian, sig-
 nifies wax, Iai or Ajin is the name of the
 village in the vicinity of which the spring of
 water containing Mumiai or Mumaijin is
 found The Mumiai was discovered in the
 time of Feridun He also says that the
 Asphaltum Selajit, Asphaltum Panjabium
 or Punjab Asphalt, an official article at
 Lahore, is brought from the hills The hakim
 and hindoo doctors use it instead of the Per-
 sian Mumiai in cases occurring from exterior
 violence Half way between Behbahan
 and the river Kurdistan, are the ruins of
 Airejan or Aigan Near the Straits of
 Teng-i-Teko, from whence the Kurdistan
 river issues into the plain, and not far
 from the village of Pesbkei, is a fissure high up
 in the mountains, out of which runs a black
 substance resembling pitch, which is gather-
 ed by the natives and is much esteemed in
 Persia for its healing qualities, especially for
 bruises and fractures It is called Mumia or
 Mumia-i-Nai from the village Nai-deh at its
 bottom Shuaz sustained the shock of an
 earthquake about the year 1810, when this
 fissure was enlarged and the Mumia since
 flows out more copiously The excessive
 esteem in which it is held by the Persians
 may be judged by mentioning that Ali
 Murad Khan sent about an ounce of Momai
 enclosed in a gold box to the empress
 of Russia De Guignes alludes to it as the
 Moumanni or Moumiani blanc and in the
 Oriental Geography which was translated
 by Sir William Ouseley, it is said to be
 brought from a mountain in the district of
 Simbel, near the borders of Pars, and it is
 alluded to also in the Ajaib-ul-Makhlukat
 and the Jahan Numa Baron de Bode
 surmises that this is the Sarcocolla of
 Dioscorides in 99, which is described as
 obtained from Persia and to have possessed
 wonderfully healing properties It is a
 hard black substance and when about to be
 used, is mixed with melted sheep's fat, and

while hot, the bruised part is well rubbed with it. Sir William Ouseley derives its name from Mom-i-Ayi, the wax of the village of Ayi, and states that the Momai of Darabjod is alone reckoned genuine.

The Shih-lan-yu of the Chinese, said to flow from wells or springs, yellow and liquid, black, but becomes thick and clear like varnish, then a sulphur smelling, penetrating, inflammable substance, it is obtained from several sources. The Shih-ts'ih or stone varnish of the Chinese is obtained in Hankow, Yen-ngau-fu, Shensi, Liehau or Liechau, Nan-hung-chau in Canton province, places between Birmah and Yunnan, and in the S E of Se-chu'en, is used externally and internally as a medicine, to burn in lamps, and to lubricate barrow wheels. In China, a kind of naphtha or rock oil, Mang-ho-yu, resembling Rangoon tar is obtained in the Corea by distilling a bituminous shale, and at Tung-shao, near Tam-sui in Formosa, are wells yielding some sorts of paraffin or thick bitumen, differing from the Rangoon and American earth oils. There are oil wells, or fire wells at Kia-ting-fu in Sech'-uen, which yield an inflammable gas, and an oily, greenish, combustible petroleum like liquid, containing paraffine. The wells are from five hundred to three thousand feet in depth also, Tseh-chau-fu, in the S W of Shansi furnishes a kind of petroleum or rock oil—*De Bode, Hongberger, p 238-9 Bingley I, 150 Poole's Statistics of Commerce, p 14, Smith Mat Med of China*

MOMA-KHA, ? BURM, *Sax tetrasperma* Roeb. In Amheist, its timber is employed for gun stocks, it is a reddish, softish wood, close and compact, fit for turning purposes, and exempt from attacks of insects.

MOMANO, GUZ. A mohammadan weaver or cultivator in Cutch.

MOMAY. Dr J D Hooker observed in the month of September, that "birds flock to the grass about Momay, Larks, Finches, Warblers, abundance of Sparrows (feeding on the Yak droppings), with occasionally the Hoopoe. Waders, Cormorants, and Wild Ducks, were sometimes seen in the streams, but most of these were migrating south."

MOM-CHEENA, BENG. *Stilhnagrasebifera*

MOMEER, HIND? Resin of *Cannabis sativa* of a kind, finer than charias.

MO-MBIT. See India.

MOMIN, a town 90 miles from Bamo. It seems to be under the Pan-Thay mahomedans. From Momin to Bamo the road runs through Shan and Chinese territory.

MOMIN, in Berai, weavers and sellers of native cloths, the Sahi, Susi, Paiban, Khodi. They profess mahomedanism.

MOMIN. AR. A believer.

MOMIRA. HIND. See Mamian.

This vegetable is very commonly cultivated in India and Birmah at the commencement of the rains, the fruit is from ten to fourteen inches long, and from two to four in diameter, the edges are curiously notched and ridged, the flavour is bitter, and it requires to be soaked before being cooked, sometimes used in brewing. The green fruit is used in curries, &c., is known by the name of small snake gourd in Ajmeer, it is sown at the commencement of the rains, but may be continued during the cold season, it is a bitter fruit, very rough skinned, the edges have a very wrinkled appearance, when ripe it is of a beautiful deep red and yellow. The natives fry and eat them, but they are principally used in curries, they require to be soaked in salt and water before dressing. They sell from one to two pice a seer, act as an anthelmintic.

A variety, *Fructibus oblongis*, with oblong fruit,

Comboo pagul kai,	TAI	Pandi pavel	HOKI MAT
Lumba enela,	DIK	Deerga Kuavulhe,	SIND
Commoo Kakaham,	TEL		

is a very valuable pleasant tasted and wholesome vegetable though perhaps a little too bitter. It is about four or five inches long and of a wrinkled and scabious appearance outside. The natives sometimes make curry of it, but prefer it fried. In some parts of the country the Tamil name is pronounced Kombu-pava-kai, another fruit, called Nerico pava-kai, belonging to the Cucurbitaceae, is sold in the bazaars. Roeb

MOMUND, an Afghan tribe. The Upper or Hill Momund occupy the hill range between the Punjkoira and the Kuner rivers, and possess the Kunrappa pass. Two of their kheels are nomadic and in summer move to the head waters of the Helmund. The Upper or Hill Momund country extends from the south-western Swat border to a little beyond the Kabul river. Both banks of this river are in their possession, and their capital, Lalpooia, where the head of their tribe resides, is situated near the left bank. They owe allegiance to the Kabul government, though subject to an almost nominal control, and in the treaty with the Amu Dost Mahomed Khan he undertook to restrain them from hostility against British subjects. Their militia can muster about 12,000 fighting men. They are tolerably good soldiers, though not equal to the men of the most martial tribes. Their hills overhang the fertile strip of British territory, enclosed between the Swat and Kabul rivers near their confluence, known as Doaba, and this portion of the border is not more than 25 miles distant from Peshawur. The

MON

three sections of the tribe that have come in contact with the British are the Pindée Akee Momund, the Alumzye Momund and the Michnee Momund

The Michnee Momund, after annexation, were allowed to hold from the British Government, a hief or jagheer in Doaba, the fertile triangle near the junction of the Swat and Cabul rivers, of which they collected the revenue. A portion of the lands they cultivated themselves, the remainder they farmed out to other tribes of the plains as tenants. Many of their clansmen dwelt in the plains of Michnee and some in the neighbouring hills. They traded in the Peshawur valley. The Alumzye Momund, whose headquarters are at Gundao, in the hills, also had a hief of Punjpao in British Doaba, chiefly cultivated by tenants. A few of their men lived in the plains and the majority in the hills. These also traded in the valley. The Pindée Alee Momund, at a former period, had held a similar jagheer in Doaba, but not since British rule. These have few relations either with the Government or the people of the Peshawur valley. They inhabit a very strong locality in the hills. The hiefs were originally granted by preceding Governments to the Momunds as black mail to buy off depredation.

Momunds of the Plains are a section of the Momund tribe who have colonized in the South-Western portion of the Peshawur district. They are now respectable cultivators. They maintain friendly relations with their neighbours, the Afreedee. Their chiefs hold jagheers, but the support they give to government in return is lukewarm. They have not fraternized with their fellow Momunds of the hills, but they have not cordially co-operated against the Afreedees, of whose vengeance they are perhaps apprehensive. See *Afghan, Khyber*

MOMUNDPOOR See *Punjab*

MOMYAI, an "osteocolla" or rare medicament, usually the specimens consist of hardened tar or petroleum or even lignite. See *Momia*

MON is the native name of the people of Pegu. The Burmese call them *Taheng*. The Siamese appellation is *Ming-mon*. Part of this population dwell on the Delta of the Irrawadi, *Mon* being the name used by themselves, for the native populations of Pegu, *Moulmein*, and *Amberst* in *Martaban*, but their neighbours call them *Taheng*, and the same names *Mon* or *Taheng* are given to the vernacular language of Pegu. The alphabet, like that of the Thai and Burmese, is of Indian origin, being essentially that of the Pali form of speech, and like all alphabets of this kind, it embodies a buddhist literature.

The Mon language is quite unintelligible to a Burmese or Siamese. The Mon called by the Burmans, Ta-lan, and Peguan or Pegnei by Europeans, are the race occupying Pegu. They are an East Himalaic people, who long successfully contested with the Burmans the sway over the basin of the Irawadi. They were annexed to Burma, in the middle of the 16th century, but again threw off the yoke in the beginning of the eighteenth century and subjugated all Burma. Their range embraces the delta of the Sa-luen, where Montama or Martaban was then chief port. They long preceded the Siamese in the Tenasserim provinces, and the languages of the Si-mang and Binua of the Malay Peninsula retain deep traces of their ancient influence to the south. A colony is also found in the basin of the Menam. Before the great southern movement of the Lau, the Mon appear to have occupied that basin also, and to have marched and intermixed with the closely allied Kambojans of the lower Mekong. Mr. ORiley thinks that the Mon are only distinguishable from the Burman by their less Mongolian and more Rakhong aspect. They appear to have been considerably modified by the Indian element which has always been very powerful at the head of the Bay of Bengal. They seem to have been at one time the chief traders eastward of the Bay of Bengal. The Karen also preceded the Burman race in the delta of the Irawadi, and are the joint occupants with the Mon. They are also found in the lower plains of the Saluen, the deltas of the Se-tang and Irawadi, the middle basin of the Se-tang as far as Tongo, and in Tenasserim. In Martaban there is also a remnant of an allied tribe, the Toungh-thu. Both the Karen and the Tounghthu, belong to the Yuma branch of the Tibeto-Burman family. The long and narrow hill track between the valley of the Irawadi and the Sa-luen as far north as 23°, is occupied by cognate tribes called Ka-ien-m (Red Karen) who are said to speak a very ancient dialect of the Yuma family. This branch has a parallel range on the western side of the Irawadi. In their traditions, they assert that they preceded the Burmans as the dominant people of the basin and they seem from very ancient times to have occupied the whole of the valley southward from the valley of the Banak on the west to the borders of Yunnan. No trace of the Mon is now left along the Yuma range,—tribes of the Karen family being the exclusive holders of its inner valleys. Some of the very imperfectly described tribes on the eastern side of the Irawadi, to the north of the Ka-ien-m, viz, the Za-ba-

ing Ka-Khyen, &c, may belong to the older immigration. But the Mon is the only remnant within the ancient Ka-ien province, and its earlier preservation is doubtless owing to the same causes, its arts, civilization and wealth, which have enabled it to hold its own against the Tibeto-Burman horde of the Irawadi. The Nicoban Islanders appear to have been an early colony of the Mon race in its pure or more west Chinese and less Indian condition. They are flatter faced and more oblique eyed than the Rakhong and Mon, in these resembling the more sequestered hill tribes of the Burman race. In some islands they have been much mixed with Malay colonists. Nicoban phonology is allied to that of the Silong and Sunang. The first migrations from the northern side of the Himalaya is now best represented by the Annam, Kambojan, Mon and Lau tribes, who appear to have been at a later period gradually pressed by the Tibeto-Burman tribes, to the eastward and southward. The Mon Annam or East Himalaic tribes, occupy the territory bounded on the north, by the left side of the valley of the Brahmaputra; to the head of Assam and thence drawn thence eastward along the range in which the Irawadi has its sources, and across the converging meridional chains, beyond, to the most eastern, the Manghai, which separates the Krung from the M-Kong. The Annam, Kambojan, Siamese, Mon, Burman and the other Ultra-Indian languages are all characterised by strong complex sounds. The Annam and Siamese abound in complex vowel sounds and the Burman family in complex consonantal sounds which are harsh in Singpha, less so in Rakhong, and much softened in Burman. The Annamese group, amongst whom are the Moy, are found in Cochinchina and Tonkin. They are a section of the division to which the Chinese belong. Two thousand years ago, or two centuries before Christ, the Chinese found the Anamese, in possession of the basin of Sang-Koi. The Anamese, in size, form of the head, and person, expression and temperament, have a closer resemblance to some Indonesian tribes. The Javan group has a larger admixture of the Anam type than the Sumatran or Borneo. Anam heads are common in eastern Java and especially among the Bawian and Madura. The Malaysians and western Javans have frequently a more Siamese form. The Anamese want the huge straight faces, flat occiput, lowness of the hairy scalp, comparatively small and firm mouth, hard staring eye and grave expression of the Siamese. Anam is Cochinchina. Laos and Ahom belong to Anam.

The Burmans, the predominant people of

MON-ANAM

the basin of the Irawadi, occupy the lower part of the basin above Pegu, the southern part of the upper basin and the valley of the river beyond, as far as Ba-mo. They are also found in the delta, but their progress there has been comparatively recent, and the prior inhabitants still form the greater majority. Their native name Ma-ian-ma, or M'an-ma, whence their softened modern M'yan-ma, M'a-ma, is the origin of the European corruption of the Burman. The principal seat of the Burman power appears to have been for the longest periods in the same part of the basin where it now is. In the era of their greatest stability and prosperity, their capital was at Pagan probably the place of that name above Ava from the second to the middle of the fourteenth century. Previous to this, on their first advance from Aiacan, they appear to have conquered the northern part of the ancient kingdom of the Mon—for their capital was for 395 years at Prome. It was not till the middle of the sixteenth century that they succeeded in annexing Pegu. But in the middle of the eighteenth, the Mon threw off the yoke and in their turn subjugated all Burma for a short period. The Burman race differ from the Anamese in being stouter and darker, and in the head being Drya-Polynesian or Turanian oval, and not obliquely ovoid. The head varies greatly and the conical forms show a tendency to the Burman contraction of the forehead, rendering the lateral expansion of the forehead very marked. The normal, or non-Indiansed Burman head, appears in many respects to resemble the coarse Sumatran, Javan, Bornean and Polynesian. This softened Turanian type is decidedly allied to the oblong square and oval Chinese type and not to the ovoid and orbicular type of the Tibetan, some of the Himalayan-Gaugetic, the Anam and the Celebesian tribes. The Burmans on the west more often resemble the handsome Asianesian tribes found in Borneo, some parts of East Indonnesia, and Polynesia. Burmans and Malays are somewhat stouter than the Siamese, the average height being probably about 5 feet 2 inches. Burman women are more nearly the companions and not the slaves, of the men. But the Tibeto-Burmans and the cognate Indonesian tribes, permit great license to both sexes, prior to marriage, when chastity is not required.—*Latham's Ethnology*

The current and convenient principal coin of the Malay and Philippine Archipelago is at present, and has long been, the hard Spanish dollar, the peso duro of the Spaniards, and that with globes and pillars, containing 3709 grains of pure silver, and worth in sterling money 5179 pence, has an universal preference. The English rupee and Dutch guilder are but of local currency and always, more or less at a discount. The dollar, in the native languages, is known by various names, the Malays usually call it real, which is, no doubt, an "abbreviation of the Spanish real de a ocho, or a piece-of-eight." The common name with the Javanese is ring git, which literally means "see-me figure." A great variety of small coins of brass, copper, tin and zinc are in circulation throughout all the islands. The most frequent of these is the Dutch doit, of which about 300 ought to go to a Spanish dollar. The intrinsic value of all such coins, however, have no relation to their assumed one, and being usually over issued, they are generally at a heavy discount. The small coins of Palembang, Achin, Bantam, and Queda are of tin. Those of the latter place go under the name of tia, which is, however, only the word "stamp" or "impression." Of these 160 are filed on a filament of ratan, of which 8 strings or 1280 coins are considered equivalent to a hard dollar. In Bah and Lomboc, the currency consists of Chinese Zinc coins with a hole in the middle for filing them on a string, each string having 200, and five of these are called a siah, that is, "one thousand," being the highest denomination of money in the reckoning of the inhabitants of these islands. Their value rises, and falls in the market according to the supply, like any ordinary article of merchandise, so that a Spanish dollar will sometimes buy 800 of them, but often as few as 500 only. All these small coins are, generally known by the Javanese name of pichis, corrupted pitis by the Malays, a name which had extended to the Philippines. The only

native country of the Archipelago in which a coin of the precious metals seems ever to have been coined, is Achin. This is of gold of the weight of nine grains, and of about the value of 11d sterling to which European traders have given the name of a mace, a corruption of the Malay mas, itself a corruption of the Sanscrit, masha, the name of an Indian weight. All the coins of this description that have been seen are inscribed with Arabic characters, and bear the names of the sovereigns under whom they were struck, so that they are comparatively modern. The Javanese appear to have coined some of their own money, as we find from many examples excavated from old temples, and other places.

Money seems to have been coined in China, in gold and silver and lead, so early as Confucius' time, but money payments are still made in kind or by pieces of silver. Most of their calculations are made by a reckoning board. There is no coined money in China, except the brass pieces with a hole in the centre. Silver is sold by the weight, and an ounce is the equivalent of from 1700 to 1800 of these brass coins, which are called "sipek" by Europeans, they have some pieces of brass called tsian, and in Mongol tcho, of which the inhabitants of Siberia make Tchok and Tchek, they are of less value than a copee. A kind of notes are in circulation among private persons.

In British India, it was enacted that from the 1st September 1835, the coinage of former rupees should cease at all the mints throughout India, and that in future there should be coined a rupee (with doubles, halves and quarters) to be called the Company's rupee which should contain 165 grains (11-12ths) pure silver, and 15 grs (1-12th) alloy. This new rupee, which was made a legal tender in all payments, is nearly equal to the former Furruckabul, Mudras and Bombay rupees, and is received as an equivalent by them and for the Sonat rupee, and for 15-16th of the Calcutta Sicca rupee. It is worth, reckoning silver at 5-6d an ounce, 1s 11d and 2s 0½ stg, its current value being 2s. The Company's rupee bears on the one side the head of the reigning sovereign of Great Britain and in the obverse, the words E I Co and the designation of the coin in English and Persian. It was also enacted that from the 1st September 1835, no gold coins shall be coined at any mint in India except gold mohurs or 15 rupee pieces (with the sub-divisions containing each 165 grains (11-12ths) pure gold, and 15 grains (1-12th) alloy. Such mohurs are consequently worth 29s 2 each

These coins are marked in the same way as the new rupees but they are not a legal tender

The Persian coins are of gold, silver, and copper, each metal being struck in almost its pure state. The gold money are called *tomans*, one of which, in intrinsic value may now be equal to ten shillings English, they were worth more, formerly, but during the last fifty years, their size and weight have gradually decreased. There are two sorts of silver money, the highest in value is the real, eight of which amount to a toman. The smaller silver coin is called the *white shy*, eight of these being equal to a real. The copper money has the name of *black shah*, and twenty four of them amount to one real. Tomans are coined in almost every great province, but they differ much in actual value, though all pass current for the same number of real.

Payments are made, in Turkish dominions, in piastres and Spanish dollars, fifteen of the former being equal to one of the latter. The pristic is divided into forty para.

A pound sterling is worth seventy, to one hundred piastres — *Prinsep's Tibet, Tartary and Mongolia*, p 50. *Crawford's Dictionary*, p 285, 286. *Robinson's Travels*, Vol II p 1. *Porter's Travels*, Vol I p 250.

MONG-DAYAT-NEE, BURM, or Red-mong-day it, a tree of maximum girth 2 cubits, and maximum length 15 feet. Not abundant, but found on the sea-shore from Amherst to Meigu and on the Callagouk islands. When seasoned, it floats in water. Used for crooks, and straight parts also of ships, and boats is a light tough wood with a good grain, but too liable to rot to be recommended — *Captain Dance*.

MONG-DAYAT PEW, BURM, or White mong-dyat, a tree of maximum girth 2½ cubits, and maximum length 22 feet. Scarce, but found all over the Tenasserim provinces near the sea and at the mouths of the rivers. When seasoned, it floats in water. It is not a good wood, being very perishable — *Captain Dance*.

MONGHIR, L 25° 27' 1", N L 86° 40' 2" E in Bengal, in Bahar province, on the right bank of the Ganges. The level of the railway tunnel is 389 ft. The Mean height of the station, ab 200 ft above the sea.

The town is the chief place in a revenue district of Bengal formed out of the ancient Bahar. It is written Moughin and Monghyr and is a pretty town in a charming green valley, with the broad river washing it on two sides and hills in the back ground. Monghyr was captured on the 10th October

1763 Monghyr, is celebrated for its iron manufactures, especially of muskets, in which respect it is the Birmingham of Bengal. Generally speaking, these weapons are poor, though stamped with the first English names. A native workman will, however, if time and sufficient reward be given, turn out a first rate fowling-piece. The inhabitants are reported to be sad drunkards, and the abundance of toddy-palms was quite remarkable — *Hooker's Himal. Jour* Vol 2 Page 87. *Tr of Hind* Vol I P 107.

MONGHOL, See Haiyu, Chetang Mongol.

MONGHY PAITAN a town in Beia.

MONG-NYEN, BURMESE *Sinapis orientalis*.

MONGOLIA consists of four great divisions, viz Inner Mongolia, lying between the Great Wall and the Desert of Gobi. Outer Mongolia between the Desert and the Altai Mountains, the Kokonor country between Kansah, Szechuen and Tibet and 4th the dependencies of Ala-sutai to the north of the Kalkas Khanates.

The desert of Central Asia, extends from the Atlantic to the Yellow Sea. A strip of rich vegetation occurs in its centre where the Tigris and Euphrates and their illuents enrich the country. To the westward of it are the seas of sand of the Arabian and African wastes, seldom raised above, often sinking below, the level of the ocean. To the eastward of the rich tract in Persia, Keiman, Seistan, Chinese Tartary and Mongolia, the desert consists of a series of plateaux, having from 3,000 to nearly 10,000 feet of elevation.

The great highway between Pekin and Europe, from time immemorial, has been the caravan tract from the western end of the Great Wall across the desert of Gobi. The route issues from the western end of the Great Wall, and moving through the Kiayu Pass, has to traverse N W 500 miles, of a desolate sand tract to reach the city of Khamil. At this town the road bifurcates, the upper branch leading through Balkul, Urumchi and Kuikur-usu into Dzungaria, the lower through Pijan, Turfan, Karasbar, and Kuelu to Aksa in Eastern Turkistan. While Chinese rule prevailed, Dzungaria and Eastern Turkistan formed the province of Ili.

The Gobi desert is believed to be inhabited by a lonely demon, whom they call the Gholi Biaban, or spirit of the waste, a gigantic and frightful spectre which devours passengers. It is quite an oriental idea to make

tury they lost their hold on Russia. In Central Asia, they rallied once more under Timur (1369) whose sway was again acknowledged from Karakorum to Persia and Anatolia. But in 1168, this empire also fell by its own weight, and for want of powerful rulers like Chinggis-khan or Timur. In Jagatai alone, the country extending from the Aral Lake to the Hindu Kush, between the rivers Oxus and Jaxartes (Jihon and Sihon), and once governed by Jagatai, the son of Chinggis-khan the Mongolian dynasty maintained itself, and thence it was that Baber, a descendant of Timur, conquered India, and founded there a Mongolian dynasty, surviving up to the year 1857 in the great Moguls of Delhi. Most Mongolic tribes are now under the sway of the nations whom they once had conquered, the Tungusic sovereigns of China, the Russian Cossacs, and the Turkish sultans. The Mongolic language, although spoken (but not continuously) from China as far as the Volga, has given rise to but few dialects. Next to Tungusic, the Mongolic is the poorest language of the Turanian family. The Mongols who live in Europe have fixed their tents on each side of the Volga and along the coast of the Caspian Sea near Astrachan. Another colony is found south-east of Sembrusk. They belong to the Western branch, and are Olot or Kalmuk, who left their seats on the Koko-nui, and entered Europe in 1662. They proceeded from the clans Dumbet and Toigod, but most of the Toigod returned again in 1770, and then descendants are now scattered over the Kugisian steppes. For a time at least there were two Mongol dynasties in Central Asia, between the frontier of the Great Khan and the Caspian. Kaidu, great grandson of Chinggis, through his second son and successor Okkodai, and who disputed the sovereignty with Kubli, through his, represented one of these, whilst that of Chagatai was the other. The Mongols of the Russian empire comprises six Kalka tribes the Buriat and the Kalmuk.

The Buriat area occupies the parts about Nizhni Udinsk, to the east of the Lena, and extends to the country of the Khori and Barguzin tribes (both of which it includes) beyond Lake Baikal. It is bounded on the south by the Chinese frontier, beyond which few or no Buriat are to be found, the Mongols of the northern parts of China and Mongolia, in the proper sense of the term being Kalkas. The Buriat amount to about one hundred and ninety thousand souls, some few being mahomedans, some christians, some shamanists, the majority buddhists. The latter brew an intoxicating liquor called kumiss, some of the tribes may brew beer.

The Kalmuk of the Russian Empire are 119,162 viz in the Government of Astrakan 87,556 | Saratov 692
Caucasus 20,591 | Stavropol 10,223

In 1700-1703, a Dumbet migration took place, in the same direction. One of the leaders of these movements was Anki Khan, who assisted Peter the Great against Persia. By 1771, discontent had arisen, and, a large, though partial, re-migration was effected through the secession of seventy thousand families. They left their Russian occupancy against the will of the Russians and were followed by a Russian army. They found no friends in the countries through which they passed, but, on the contrary, bitter enemies, who treated them as unwelcome visitors. These harassed them in their journey, and the Russians pressed upon them from behind. However, they either made or found a way, and forced themselves forward to the frontiers of China, which, after a loss of 20,000 families, and innumerable hardships, they reached their destination a starved and stricken remnant. They were, however, hospitably received. The Buriat Mongol, are a nomadic people who live in the provinces of Irkoutsk, south of lake Baikal.

Of the three great races in China, Chinese, Mongol and Mantchu, the predominating color of the skin of the Chinese is yellow, but yellow brown and sometimes a maroon tint occur. The face is broad and flat, cheek bones projecting, noses black, eyes oblique, beard scanty, stature above that of the Malay and Tibetan, below that of the European. The sea-coast people are skilful and enterprising, with that self-reliance which enables nations to emigrate, and we find them swarming in the Malay ports in Singapore, Borneo, and the Philippines, and numbers are in Australia, the West Indies, Sandwich Islands and California, but, except in budhist Burmah, they are not settlers, only forming temporary connections, sending all their savings, and looking forward to return, to their native land. Next to the Malay this people are the most formidable pirates of the eastern seas. The Mongol and Chinese have scanty beards. The numerous military feudatories of the Empire are scattered through the regions known to the Chinese geographers as Inner and Outer Mongolia, Uliasutai, and Tsing Hai, or Koko-nor, but there are also the troops of Tibet under the resident Minister of that country. The tribes acknowledging the sway of China are divided into Inner and Outer Mongolians. The former occupy the region to which their name refers them, the latter, all the other tracts and districts above mentioned.

Inner Mongolia, lying between the Desert of Gobi and the continuous frontier of Manchuria and China, was occupied, in 1812, by 24 tribes, differing in name, irregularly ranged under 49 standards, and divided, in uneven proportions, into six chalkan, or leagues

The Outer Mongolians were, 1st, four tribes of Kalkas of different names, under khans, which, with two fragmentary tribes attached to them formed four leagues, they numbered in all eighty-six standards, and resided in the territory north of the Desert of Gobi, geographically named Outer Mongolia, 2d, Eleven tribes, not in leagues, under 34 standards, scattered to the west of the Hulan mountains, in the south-west of Inner Mongolia, to the south of the Altai, and to the north of the Tengkin ranges, 3d, Two tribes of mohammedans, under two standards, at Hami and Tufan, within the provincial boundaries of Kansuh, south of the Celestial Mountains, and 4th, Five tribes under 29 standards round Koko-Not, called by the Chinese Tsing-Hai, or Azure Sea. There are lamas of both Inner and Outer Mongolians. Nearly every standard of the above, if not all, has a native head entitled a Dzassak, whose chieftainship is, with slight limitations, hereditary, the people under then rule are collectively styled orbadu or opatu, the lamas excepted, who are distinguished as of Shapi Not, then Dzassak take the prefix lama before their title. The few tribes, or remnants of tribes, not under such chieftains, are under the more immediate authority of the Banner generals and resident Ministers from China. These last may be briefly enumerated, under the Tsangkiun of Sui-yuen are the Tumet of Shansi beyond the Wall, under the Tutung at Kalgan, on the Wall, the most privileged tribe of Chahai Bargou incorporated in Chahai, Kalkas and Eluth, under the Tutung at Jeh-ho, Tashtava Eluth, under the Fu-tutung at Huiun-pu, Eluth and New Bugou, under the Tsung-kwan at Tasangula, Solon, Taguri, Orunchan and Pilai, paying peltiy, both these being under the Tsangkiun of Sagalien. In Ih, the Tsangkiun has authority over Eluth and Chahai of his own Central Province of Ih, who have also Chinese ministers over Eluth, Chahai, and Hassack under the Tstantan Minister resident at Tarbagatai, and over the mohammadans of the eight cities in Ih, south of the Tien Shan, who are under resident ministers of different degrees.

In Uhasufu province, which receives a small garrison from the Tsangkiun of Shensi, there are Tangun Uiankai, some of

them Yumu headsmen, some Tasang peltiy-men, under the Tsangkiun in observation at Kuun, who is father supreme over the ministers at Kobdo, having charge of the Mingat, Eluth, Chaksim, Altai Uiankai and Altai-Not Uiankai of the far province.

On the borders of Tibet are Tamuh, or Dam Mongols, under eight standards, amenable to the authority of the resident Tsantsan.

As to the feudal constitution of these tribes. The six mug, chalkan or leagues, into which these twenty-four tribes are formed are each under a head or elder, and a lieutenant, chosen from a list of Dzassak presented to the emperor by the Colonial Office. Every tribe is bound to assist any other in the same league which may be in danger. Once in three years, the leagues are mustered by four high commissioners selected by the emperor from incumbents of high civil and military posts in the empire, then visit is of a thoroughly inquisitorial character. The Dzassak are in turn compelled to pay visits to Peking, the year in which it is not the duty of this or that Dzassak to go, he sends a Taikih. On stated occasions, all assemble in court costume to do homage in token of fealty before the door consecrated to Majesty at the head quarters of the tribe.

The internal economy of the Outer, is much the same as that of the Inner, Mongolians. Then Dzassak are ennobled by all the same titles except Tapunang of which there are none. Some of the Dzassak, whether otherwise ennobled or not, have the title Khan, which is superior to any of the rest, and brings with it a higher allotment of pay and gifts. Then chalkan or leagues, have each a captain-general, and a lieutenant like the Inner Mongols, and are like them mustered and inspected triennially. Then military organization is, with a few exceptions, the same. First, in the region of Outer Mongolia, we find four leagues of Kalkas, each under a khan. 1st, the Tuche-tu khanate, numbering 20 standards under 58 tsoling, 2d, the Sain-nori 24, including two Eluth standards, in 38½ tsoling companies, 3d, the Tsetsen, 23 standards in 46½ companies, 4th, the Dzis-saktu, under 19 standards; including 1 of Khoits in 24½ companies. Now come the Durbet in two wings, each of which is a league under a lieutenant general, appointed as above. The left comprising ten standards of Durbets and one of Khoits, in 11 companies, the right, three of Durbets and one of Khoits, in 17 companies. Their position is beyond the north-west frontier line of the Dzassaktu, they extend across the province of Kobdo north of the

city of that name, and their troops, amounting in 1812 to 1400 makia, were under the Tsantsan of the Chinese Government at Kobdo. The two wings are subject to one khan. Under the same officer of Kobdo, are the troops of the New Turguth of the Uirungu river, in the south-east of the same province, and Hoshoit of the Djabkhan farther north. The former under two standards in three companies, which would give but 150 makia, form a league, the single standard and company of the latter, furnishing 50 makia, belong to none.

Under the Kuirun general are 595 Tasang families of Uirankai Tangun, paying 2 skins of marten fur, and 412 paying 80 gray mouse skins, under the Tsantsan of Kobdo, 412 of Altai Tangun, paying gray mouse skins, 250 marten skins, and 429 paying four fox skins each. Also 61 of Altai Nor Tangun paying gray mouse skin, and 147 paying marten fur. Of Yumuh there are, under the general, eight companies of Uirankai, and under the Tsantsan, seven of Altai, and two of Altai Nor.

Of the leagues whose soldiery is under command of the Tsangkurun of Ili, of whom some mention has been made before, there are four of Old Turguth and one of Hoshoit distributed in five circuits. The north contains the Old Turguth of Hopoksiloh, three standards in 14, the east, those of Tsiuholang, two in 7, the west, those of the river Tsing one, in 4 companies. These are north of the Tengkurun, stretching well into Tarbagatai.

The Mongolians of Central, Northern and Eastern Asia are a squat, flat faced, peculiar eyed, beardless people. The Mongol is of moderate stature, but his large leather boots, and wide sheep-skin robe, give the person a short and squat appearance. To complete the portrait must be added a clumsy, heavy gait, and a harsh, shrieking language, bustling with terrible aspirations. Yet notwithstanding this harsh and savage exterior, the Mongol is full of gentleness and bonhomie, he passes suddenly from the wildest and most extravagant gaiety to a melancholy that has nothing repulsive. Timid to excess in general, when excited by fanaticism or the desire of vengeance he displays an impetuous courage that nothing can arrest, he is simple and credulous as a child, and is passionately fond of stories and marvellous recitals. To meet a travelling Lama he always reckons a piece of extreme good fortune. The Si-Fan, or Oriental Tibetans, are nomadic, like the Mongol-Tartars, and pass their lives wholly in the care of their flocks. They do not lodge, like other Mongols, in Youita, cover-

ed with felt, but in large tents of black linen, of a hexagonal form, without any wood-work inside to support them. The side angles of the base are attached to the ground by nail, and the top supported by cords, which, are fastened into the ground at a certain distance from the tent. The nomadic Si-Fan are easily distinguished from the Mongols by their more expressive physiognomy, and their greater energy of character, their faces are not so flat, and their manners have an ease and vivacity which contrast strongly with the heaviness of the Tartars. Their encampments resound with noisy songs, merry games and shouts of laughter, but with these dispositions to gaiety and pleasure, they are of a warlike character and indomitable courage, and though their names are on the list of tributary nations, they obstinately refuse both tribute and obedience to the emperor of China, indeed, they manifest the most profound contempt for Chinese authority. Some of them carry their predatory incursions to the very frontiers of the empire, and the Mandarins do not dare to interfere with them. They are good horsemen, though, in this respect, they do not equal the Tartars. But, besides attending to their flocks, they practise some kinds of industrial occupations, and turn to account the wool of the sheep and the long hair of their oxen, weaving from them a coarse kind of cloth, which they use for tents and clothing. When they assemble round their great cauldron full of milk-tea, they give themselves up freely to their gossiping humour, and their taste for stories about Lamas and robbers, one need only set them going, and one is sure of seeing them display an apparently exhaustless repertory of anecdotes, local traditions, and legends.

There is a rollster kept of the Mongolian nobles and they are obliged to present themselves every year at Peking. If the emperor cross the border to hunt, they do him homage at his hunting-ground instead, and the expedition is under the conduct of some of them, and the rest attach themselves to his suit while it lasts.

The latest investigator of the general subject of human affinities includes in the great Mongolian family not merely the high Asian nomades or the Turk, the Mongol and the Tangus, but also the Tibetan, the Chinese the Indo-Chinese, and the Tamulian. And under the term, Tamulian, he includes the whole of the aborigines of India, whether civilized or uncivilized, from Cape Comorin to the snows, except the inhabitants of the great mountainous belt confining the plains of India towards Tibet, China, and Ava.

These last he thinks are, in the North West, derived from the Tibetan stock, and in the South-East from the Indo-Chinese stock, the 92° of East longitude, or the Dhamsu river of Assam, apparently forming the dividing line of the two races, which are each vastly numerous and strikingly diversified, yet essentially one, just as are the no less numerous and varied races of the single Tamman stock. Mr. Hisslop took almost a similar view, as the result of his philological inquiries.

The Mongol in Kabul, Herat and Persia are called Kalmuk in Herat and Afghanistan, and were introduced from Bukh towards the end of the 18th century. Those of Kabul and Persia, are now called Amik or Chai Amik, and the Hazara. The term Amik is a Mongolian, Mantshu and Turk word, meaning tube. They dwell to the north of Herat and Kabul in the range of the undulating country, which in some places assumes a mountainous, in others a hilly character, and in some parts is well-watered, in others bleak and rough, forming a watershed of two natural divisions, from the west of which flow the Mughab, the Tajend and the Furrah-Rud, and from the east, the Helmund, the south eastern feeders of the Oxus and the north western feeders of the Kabul river.

In the Derajat are warlike Baluch and Afghan tribes the most unyielding of whom are the Waziri, who continue to resist the efforts of English power to restrain their incursions on the plains. Still further north and west are the numerous tribes of Afghanistan, of whom may be mentioned the powerful Durani race and the Tajik tribes.

In the Bannu valley, there are mixed races and we may notice the Durdu in Gilgit and Chulas.

The Tibetan and Nepaleso are a Mongol race.

The Daima race occupying the Daima pass leading into Gujwal, are said to be the descendants of a body of Mongol whom Timur left behind him in Kamaon. They practise divination, taking their omens from the warm liver of the sacrificed sheep. They eat the yak and the cow, inter them dead for a time and then, in the month Kirtik, they exhume and burn them. The great aboriginal stock of the inhabitants of the mountains, east of the river Kab, as in Nepal, is Mongol. The fact is inscribed in characters so plain, upon their faces, forms, and languages, that we may well dispense with the superfluous and vain attempt to trace it historically in the meagre chronicles of barbarians.

From Kashmir, eastwards, all the easily accessible portions of the Himalaya are occu-

piated by Arian Hindu as far as the eastern border of Kamaon and the Kali river separating Kamaon from Nepal—the Tibetans being here confined to the valleys about and beyond the snow. People of Tibetan blood have migrated into Nepal, throughout its whole length, and have formed mixed tribes whose appearance and language is more Tibetan than Indian, but whose religion and manners are Hindu. East of Nepal, in Sikkim and Bhutan, the Hindu element almost disappears, and the Tibetans are altogether dominant.

The Ugro-Tatarian languages, of High-Asia and other regions, which other writers style Turanian, are those of Dr. Pritchard a second group of nations belonging to the same great family and include the various hordes who have been known under the names of Tatar, Turk, Mongol, Mantchu, and Tungus. All these nations appear, from the result of late researches, to be allied in descent, though long supposed to be quite separate. In the vast region of High-Asia, extending from the chain of Altai to that of the Himalaya are the pasture-lands, where, during immemorial ages, the nomadic tribes of that region have led their flocks and multiplied those hordes which from time to time descended in immense swarms on the fertile regions of Asia and of Europe. Perhaps the earliest of these invasions of the civilized world was that of the Hiong nu, expelled from the borders of China by the powerful dynasty of the Han. These were the people who, after their incursion on the Gothic empire of Hermanich, made their way, under Etzel or Attila, into the heart of France. Hordes from the same regions under Togrul-Beg, and Seljuk, and Mahmud of Ghazni, and Jengiz, and Timur and Othman, overwhelmed the caliphate and the empires of China, of Byzantium, and of Hindustan, and their descendants of the shepherds of High-Asia still sit on the throne of Cyrus, and on that of the Great Constantine. As a branch of the Ugro-Tatarian, he speaks of some of the insular nations to the eastward of Asia and near the coast of the Pacific Ocean. The idiom of the islands comprised in the empire of Nippon, as well as that of the independent Lau-kin Archipelago, bears some signs of affinity to those of the Ugro-Tatarian nations, and he adds that Mr. Norris had assured him that the principle of vocalic harmony and other phenomena of the Tartar languages prevail in the idiom of the Japanese and Lankin islands. As a seventh group of his Ugro-Tatarian, he classes the aboriginal inhabitants of India, who were expelled from Hindustan by the Brahmins and the Arian people who

accompanied them across the Indus and retired as it is supposed on apparently insufficient proof, into the Dekhan. They still occupy the greater part of that peninsula, and a portion, at least, of the island of Ceylon. Their idioms—the Tamil, the Telugu and the Karnataka of the Mysore,—are sister dialects of one speech, and he considers it likely that the languages of the mountain tribes of India, the Bhil, the Goud, the Toda and others, belong to the same stock. Dr. Pritchard adds that professor Rask had conjectured that these nations are also of the Tartar stock. Their language has some of the peculiarities of structure which have been pointed out. He also observes that there are some curious analogies between the Tamulian and other dialects of the Dekhan and the languages of Australia, with which we have obtained some acquaintance through the labours of Mr. Thielkeld and several other missionaries, and from the able researches of Captain Gray.

Hindu, Mongol and Kalmuk women must not speak to their father-in-law nor sit down in his presence. A similar practice prevails amongst the Ostiak of Siberia, but with them the son-in-law will not look at his wife's mother, and the Hindu and Ostiak women never pronounce their husband's name, nor a husband the wife's name but call them man and woman.

Among the Mongol when a marriage is arranged, the girl flies to some relations to hide herself. The bridegroom coming to demand his wife, the father-in-law says, "My daughter is yours, go, take her wherever you can find her." Having thus obtained his warrant, he, with his friends, runs about searching, and having found her, seizes her as his property, and carries her home as it were by force.

Rubruk relates that he saw in the solitudes of Tartary asses that resembled mules, and he probably speaks of the animal called the hemion, *Asinus hemionus* which Messrs. Huc and Gabet often met with in numerous herds during their journey from Peking to Lha-sa, through the Mongolian steppes.

A certain kind of dumb trade prevails indeed more or less in most Asiatic countries, including Mongolia and possibly China, by which bargains are driven and concluded by two parties fingering each other's knuckles under a shawl without a word spoken. The stories of the Senic trade have arisen out of this practice.—*Rawlinson, Vol. 1 p. 1, Schmidt, Narrative, pp. 45, 53, Timkousky's Journey to Peking, I, 17, 18, 380. MONGOOS Anglo-Indian, a name applied to species of *Herpestes*, viz —
biachyus, Java
exilis, Archipelago
fuscus, *Waterh.*, Neilgherry brown mongoose
griseus, *Geoff.* Madras mongoose, India
javanicus, *Geoff.* Java, Sumatra
jerdoni
malaccensis, *F. Cuv.* Bengal mongoose
monticollis, *W. Elliot*, Long tailed mongoose
nepalensis, *Gray* Gold spotted mongoose, of Nepal
nyula, *Hodgs.* The nyul or neyool, of the Terai
smithi, *Gray*, Ruddy mongoose
vitticollis, *Bennet*, stripe necked mongoose

The current name of these *Herpestes*, is written Mongoos, Mongoose and Mungus. One species, called by the Singhalese hotambeya, is believed by them not to prey upon serpents, but to live near rivers and mud brooks, the adjacent thickets affording them shelter, and their food consisting of aquatic reptiles, crabs and mollusca. The *Ichneumon* of the Egyptians, is the *Herpestes ichneumon*, a quadruped celebrated for destroying serpents and crocodiles. It was also called *Ichneumon pharaonis*. The mongoos, animals, the *ichneumon* of the Egyptians the *Mangouste* of the French, the *Mungus* of Hindustan and the *Keere-pull* of the Tamil people, are all of active habits, and of bold and sanguinary dispositions. The *Madras mongoose* is spread through most parts of the South of India up to the Nerbuddah, the North West Provinces and the Punjab. It hunts for and eats the eggs of birds that lay on the ground, kills lizards, rats, and small snakes, is very destructive to poultry. Dr. Jerdon does not believe that it will voluntarily attack a large snake or that it is not sensible of the cobra poison, but the prevailing notion in India is that it is the natural enemy of the cobra and that the cobra poison makes no impression on it. The Bengal mongoos is of

MONKEY

similar habits to that of Madras, and is found in Bengal, Assam, Burmah, and Malay Peninsula. The long tailed mongoos, is found in the Eastern Ghats of the Peninsula of India as also is the ruddy mongoos. The gold spotted mongoos occurs from the Panjab, along the Himalaya through Bengal, to the Malay Peninsula. The Nilgheiry brown mongoos is restricted to the Nilgheries. *H. vitticollis* occurs along the western side of India from Dhawal through Travancore to Ceylon, *H. Nyula* *Hodgs* in Nepal, lives in burrows of its own making *Horsfield*, *Tennant*, *Blyth*, *Jerdon* — See *Herpestes*, *Mammalia*.

MONGRA or pakaura **HIND**, a sweet-meat.

MONGY PATTUN A town in the Dekhan, anciently called Dhank. See Balla, Mungi-pattun.

MONIKOH See India.

MONIMIACEÆ *Link* an order of plants consisting of 1 species, of Amboina.

MONITOR DRACÆNA *Link, Gray*

Talla goya **SING**

The iguana of Ceylon, about 4 or 5 feet long. A still larger species, the Kabara goya, is partial to marshy ground, and when disturbed upon land, will take refuge in the nearest water. From the somewhat eruptive appearance of the yellow blotches on its scales, a closely allied species, similarly spotted, formerly obtained amongst naturalists the name of Monitor exanthematicus, and the Singhalese appellation of this one, kabara, is suggestive of the same idea. Externally applied it is considered a cure for cutaneous disorders, but taken inwardly is poisonous — *Tennant Slet Natural History* p 272.

Apes form the sub-family Simianæ, of the family Simiadae, or monkeys, of the natural order Primates. Apes are represented in India by two species of Simia. The ancient Egyptians are said to have worshipped monkeys, and some of them in India are still worshipped. The various kinds of ape seem to have been made known to the Hebrews, Greeks and Romans, by specimens brought from Africa and India, those of the Hebrews probably from India, the Hebrew name Koph

MONKEY

being almost the same as the Sanscrit Kapi. Apes, gold and ivories could however have been got from many parts of Africa, as also from the South and East of Asia, and then Sanscrit, Ethiopian, Hebrew, Greek, and Persian names, Kapi, Ceph, Koph, Kephos or Kepos, Keibi and Kubbi, are identical and show that the apes may have been brought from any of those regions—the Singhalese, Tamil and Telugu names Kaki, Korangu and Kothi are less similar. Had the Hebrew ships visited the isles in the Malay peninsula, Sumatra, Java or Borneo, they would have known of the Simia satyrus, the Orang utan of Malacca, and Sumatra, the Mia of Borneo or have seen the Simianga syndactyla, the long arm, of which measure five feet six inches across in an adult about three feet high. Mr Russell Wallace has given the names for monkey in 33 languages of the Eastern Archipelago none of which have any resemblance to the Kapi, Kubbi or Koph of the Sanscrit, Egyptian and Hebrew, but one of them the Kuango of Balanghitam in N Celebes, is almost identical with the Tamil Korangu. The names are,

Aruka of Morella of Amboyna

Bibah, of Sangun, Siau

Budess, Javanese

Boben, of Menado and Balanghitam of N Celebes

170 species of mammalia are known to inhabit Indo-Malaya. Of these, are 24 of the quadrumana or monkey tribe, 10 of which occur in the Malay peninsula, 11 of them in Sumatra, 9 in Java and 13 in Borneo. The Orang-utan are found only in Sumatra and Borneo. The Siamang, next to them in size, in Malacca and Sumatra, and the long-nosed monkey only in Borneo. The gibbons or long-armed apes and monkeys and the lemur-like animals, *Nycticebus*, *Tarsius*, and *Galeopithecus*, are found in all the islands. With the exception of the Orang-utan, the Siamang, the *Tarsius spectrum* and the *Galeopithecus*, all the Malayan genera of quadrumana, are represented in India by closely allied species. In the Indo-Malay region are 33 Carnivora, 8 of which, a tiger, leopard, civet, tiger-cat and other are found in India and Malacca and 20 in the Malayan region. 13

have representatives in India, of closely allied species. The Malacca gibbon, *Helictes orientalis*, has the *H. Nepalensis* in the Himalaya. There are 22 hoofed animals in Indo-Malaya, seven of which are found in India and Burmah. The *Bos sondaicus* is found in Burmah, Siam, Java and Borneo. There is a goat-like animal in Sumatra, the two horned and the long horned rhinoceros occur in Burmah, Sumatra and Java, and the elephant of India is found in Malacca, Sumatra and Borneo. There are about 50 bats, of which under a fourth part occur in India, 34 rodents (squirrels, rats, &c) of which 6 or 8 are Indian, and 10 insectivora, 9 of which are peculiar to the Malay regions. The Tupia, insect-eaters, closely resemble squirrels, are almost confined to the Malay islands, as also are *Ptilocercus* Linn of Fono and *Gymnurus* Rafflesii. In Timor, there are 15 bats, and 7 land mammals, amongst them the *Macacus cynomolgus*, the common monkey of all the Indo-Malay island. *Paradoxurus fasciatus*, a civet cat, found over much of the Archipelago.

The monkey, it is often asserted manifests affection and sympathy in ways almost human. V, a writer in the *Times of India* of 25th August 1868, mentions that he once heard a number of monkeys making much noise and he sent a Bhil to ascertain the cause. The Bhil returned and mentioned that a female of the herd was carrying about a dead young one in her arms, and the rest were making a noise in consequence. Hindus believe that, except when killed by man or beast, the monkey never dies. *Hylobates*, the 'wa-wa' or long-armed ape, is the most beautiful of all the monkey tribe. The fur of this gentle little animal is grey, its face, hands, and feet, are jet black, in features it more resembles those of the human race than the orang utan. *Hylobates hoolock*, the Hoolock is the *Simia hoolock*, *Hurlan*, *H. seyrtes* and *H. coromandelus*, *Ogilby*, *H. hoolock*, *Lesson*, is a native of Assam. *Hylobates lai*, the Gibbon, *Homo lai*, *Linnaeus*, *Simia longimana*, *Schreber*, *S. albimana*, *Vigors* and *Horsfield*, and the Great Gibbon of *Buffon*, is a native of Malacca, where it is known as the white handed Gibbon. The contrast which this animal offers with *H. hoolock*, is very remarkable. The body is proportionally much shorter, and it is quite incapable of walking in the erect attitude commonly assumed by *H. hoolock*, always creeping forward when on the ground in a crouching position.

Hylobates leuciscus, the silvery gibbon, or Wow-Wow, *Simia leucisca*, *Schreber*, *Audubon* is native of Malacca.

Notwithstanding the unequalled agility of the monkey, it falls a prey, and not unfrequently, to the leopard. The latter, on approaching a tree on which a troop of monkeys have taken shelter, causes an instant, and fearful excitement, which they manifest by loud and continued screams and incessant restless leaps from branch to branch. The leopard meanwhile walks round and round the tree, with his eyes firmly fixed upon his victims, till at last exhausted by terror, and prostrated by vain exertions to escape, one or more fall a prey to his voracity.

The Chinese are skilful in teaching the smaller kinds of monkeys various tricks and persons carrying them around the country to entertain the populace with their antics are often met. Mr. Breton gives one picture of their adroitness and usefulness in picking tea in Shantung from plants growing on otherwise inaccessible acclivities which it not misrepresented rests on doubtful authority. One of the most remarkable of the monkey tribe is the "donc" or Cochinchinese monkey (*Simia nemaeus*) which is said to occur also in Kwangsi. It is a large species of great rarity, and remarkable for the variety of colors, with which it is adorned. Its body is about two feet long and when standing in an upright position its height is considerably greater. The face is of an orange color and flattened in its form. A dark band runs across the front of the forehead and the sides of the countenance are bounded by long spreading yellowish tufts of hair. The body and upper parts of the forearms are brownish grey, the lower portions of the arms from the elbows to the wrists being white, its hands and thighs are black and the legs of a bright red color, while the tail and large triangular spot above it are pure white. Such a creature matches well for its grotesque and variegated appearance with the mandarin duck and gold fish also peculiar to China. Mr. Earl mentions that in the Archipelago, he saw numbers of large black apes, called Iton, crowd the trees near the anchorage, about the time of low water, for the purpose of catching crabs and craw-fish which form their principal food. The natives assert that they put their long tails into the holes inhabited by the crabs, pulling them out when the latter bite. They also assert that the monkey's tails are sometimes held fast and the animal consequently drowned when the tide rises.

The monkeys of Malacca are very beautiful, having yellow hair, with a black ring round the neck. They are the most docile and intelligent of all the different species of the *Simia* two of them on board the

MONKEY FLOWER

Hope, with agile gambols, and highly comic, though sometimes mischievous pranks, enlivened many a heavy hour in the course of the voyage. The Singhalese have the impression that the remains of a monkey are never to be found in the forest, a belief which they have embodied in the proverb that "he who has seen a white crow, the nest of a paddi bird, a straight cocoanut tree, or a dead monkey, is certain to live for ever." This piece of folk lore has evidently reached Ceylon from India, where it is believed that persons dwelling on the spot where a Hanuman monkey, *Presbytis entellus*, has been killed, will die, that even its bones are unlucky and that no house erected where they are hid under ground can prosper. A white monkey taken between Ambessusse and Konegalle, where they are said to be numerous, was brought to Colombo. Except in colour, it had all the characteristics of *Presbytis cephalopterus*. So striking was its whiteness that it might have been conjectured to be an albino, but for the circumstance that its eyes and face were black. White monkeys have been seen near the Ridigalle Wihara, in Seven Korles and also at Tangalle.

Monkeys appear to frequent regions exceeding 11,000 feet in height, the *Presbytis schistaceus*, *Hodgs*, on ascending higher than others. These monkeys, called "Langur" by the natives, have been frequently seen, more especially in Garhwal and Simla, at the height of 11,000 feet, 'leaping and playing about at this elevation,' as Captain Hurton says, "while the fir-trees among which they sported, were loaded with snow-wreaths." The *Macacus rhesus*, *Audub* is met with as well in India (particularly in Bengal and Assam) as in the Himalaya, where it frequents heights of about 8,000 feet. Turner mentions having seen a large troop of these animals in Bhutan, which are in Ceylon held in great veneration, but in Western Tibet, and farther to the north, no monkeys have yet been found.

Cynopitecus nigrescens, is the black baboon monkey of Celebes.

Rats, monkeys, and squirrels commit great depredations in fruit time. They are partial to the sweet pulp which they digest but evacuate the beans whole.—*Elliot, Horsf* *Jerdon, Low's Sarawak*, p. 80. *Williams' Middle Kingdom*, p. 247. *Earl*, p. 116 to 117, *Wathen's Voyage* p. 164. *Ten nent Sketch Nat Hist* p. 11-8 31. MONSON A general who advanced against Holkar in 1804, but retreated towards Agia, deserted by his Jeypore allies

MONSOON

Mausam, *Arab* | *Etesiae* Greek from
Etesian winds, *Eng* | *eros* a year

In Hindustan, the people usually arrange the year into three periods, the "choumasa" or "Burk'ha" which is the rainy season of four months duration, after which is the "Seela" or "Jara" or "Mohasa" the cold season, followed by the Dhoop-kala or

K'huisa or hot season This division indicates generally, the course of the seasons in India, though in one locality, the rains of the hot or the cold seasons may be somewhat more prolonged than in another The monsoons or periodical winds are known in the Indian Ocean, and indeed generally throughout India, by the name of the south-west and north-east monsoon, these being their directions at sea

The south-west or summer monsoon, in almost all parts of India, is a sea wind, and is therefore loaded with vapour

In Northern India the rainy season commences later than in the peninsula, because it is not till June that the sun acts sufficiently energetically on the Tibetan mountains and the plains of temperate Asia to attract in that direction the full force of the monsoon This wind, after passing over the plains of Bengal, comes in contact with the Khasia mountains, upon which, and upon the whole chain of the Himalaya, it discharges itself in heavy rains diminishing in amount as we advance westward, with the increasing distance from the sea At Calcutta the wind, during the whole of the monsoon, from April onwards, blows from the east to south, but after the beginning of August when the great rain-fall in eastern Bengal has considerably lowered the temperature of that province, (the arid plains of the Punjab, however, remaining excessively heated) it becomes S S E, and in September still more easterly After the autumnal equinox, the great mass of the Himalaya becomes intensely cold, and the whole of the continent comparatively cool, while the southern hemisphere gets powerfully heated, the monsoon is everywhere a land wind, except in the Malayan peninsula and on the coast of the Carnatic From the vernal to the autumnal equinox a great part of India is preternaturally hot, but from October to February (inclusive) it is comparatively cool, and at the same time the continents of Africa and Australia become preternaturally hot During the summer months therefore, or the hot season as it is commonly called in India, the wind blows from the south towards the north, while in the winter or cold season it blows from north to south From the vernal till the autumnal equinox, the heat of a great part of India, is still however great but after the autumnal equinox the great mass of the Himalaya becomes intensely cold and the plains of India generally become cool and when the north-east monsoon prevail, it is every where a land wind except on the coast of the Carnatic and in the Malayan peninsula In Malaya it

blows over a great extent of sea, and is therefore very rainy but in the Carnatic the width of the sea is not great, so that the rainfall, though well marked, is less, and terminates long before the end of the monsoon, probably from the wind acquiring a more directly southerly direction, after the sun has reached the southern tropic The amount of rain varies prodigiously in different parts of India, from almost none to six hundred inches, but the rain-fall affords no direct criterion of the humidity of any climate, for the atmosphere may be saturated with moisture without any precipitation taking place Thus, while in Sikkim 1° for 300 feet is the proportion for the elevations below 7,000 feet, on the Nilghiri Hills it is about 1° for 310 feet, in Khasia 1° for 380 feet, and elevations of Nagpur and Ambala produce no perceptible diminution in their mean temperature, which is as great as that which would normally be assigned to them were they at the level of the sea

Monsoons prevail in the Indian Ocean, between Sumatra and the African coast, and between 3° S L to the Asiatic coast including the Arabian Sea, the Gulf of Bengal, and between the Island of Madagascar and coast of Africa They are distinguished as the N East and the S West monsoons Both of them bring rain, and that from the South west prevails from the latter part of May till the middle of September and is chiefly felt on the west coasts of India and Burmah and northwards towards the Himalaya The N East monsoon prevails from the middle of October till the middle of December and its force is chiefly felt on the Eastern coast of the peninsula of India The countries and islands of South Eastern Asia have, thus, a wet and a dry side The S W monsoon drops much of its rain on the Western Ghats of the peninsula of India and moisture brought by the N E monsoon is deposited principally on the eastern side of the peninsula The South side of an island in the S W monsoon has one continuous shower but as the clouds spend their rain on the central mountains the North coast is quite dry In the N E monsoon this is reversed

In India and upon its seas the monsoon phenomena are developed on the grandest scales These remarkable winds blow over all that expanse of northern water that lies between Africa and the Philippine Islands, Throughout this vast expanse, the winds that are known in other parts of the world as the N E trades, are here called N E monsoon, because, instead of blowing from that quarter for twelve months, as in other

MONSOON

seas, they blow only for six months. During the remaining six months they are turned back, as it were, for, instead of blowing towards the equator, they blow away from it, and instead of N E trades we have S W monsoons.

The S W monsoons commence at the north, and "back down," or work their way towards the south. Thus they set in earlier at Calcutta than they do at Ceylon, and earlier in Ceylon than they do at the equator. The average rate of travel, or "backing down to the south," as seamen express it, is from fifteen to twenty miles a day. It takes the S W monsoons six or eight weeks to "back down" from the tropic of Cancer to the equator. During this period there is a sort of barometric ridge in the air over this region which we may call the monsoon wave. In this time it passes from the northern to the southern edge of the monsoon belt, and as it rolls along in its invisible but stately march, the air beneath its pressure flows out from under it both ways, on the polar side as the S W monsoon, on the equatorial as the N E

As the vernal equinox approaches, the heat of the sun begins to play upon the steppes and deserts of Asia with power enough to rarify the air, and cause an uprising sufficient to produce an indraught thitherward from the surrounding region. The air that is now about to set off to the south as the N E monsoon is thus arrested, turned back, and drawn into this place of low barometer as the S W monsoon. These plains become daily more and more heated, the sun more and more powerful, and the ascending columns more and more active, the arc of intruding air, like a circle on the water, is winded, and thus the S W monsoons, "backing down" towards the equator, drive the N E monsoons from the land, replace them, and gradually extend themselves out to sea.

The S W monsoon commences to change at Calcutta, in $22^{\circ}34'$ N, in February, and extends thence out to sea at the rate of fifteen or twenty miles a day, yet these winds do not gather vapour enough for the rainy season of Cherra Ponjie, in lat, $25^{\circ}16'$, to commence with until the middle or last of April, though this station, of all others in the Bengal Presidency, seems to be most favourably situated for wringing the clouds. Selecting from Colonel Sykes's report of the rain-fall of India, those places which happen to be nearest the same meridian, and about 2° of latitude apart, the following statement is made, with the view of showing, as far as such data can show, the time at which the rainy season commences in the interior,

MONSOON

* Setting in of the E. W. monsoon
† Ending of the S. W. monsoon

Setting in of the E. W. monsoon

It appears from this table that between Calcutta and the equator the S W monsoons are the prevailing winds for seven months, the N E for five. Each monsoon, like the trade winds blows from a higher to a lower barometer. Taking up the clew from this fact, and resorting again to the graphic method for illustration, we may ascertain, with considerable accuracy, not only the relative strength of the north-east and south-west monsoons of the sea, but also the mean height of the barometer in the interior of India during the south-west monsoon, supposing that monsoon to go no further than the mountain range, which may be taken at a mean to be about the parallel of 30° north.

The south-west monsoons—coming from the sea, carry into the interior rains for the great water-shed of India. They bear with them an immense volume of vapour, as is shown by the rivers, and confirmed by the rain-fall of Cheranapoy, and at 126 other stations. Cheranapoy is 1,500 feet above the sea level. It reaches quite up to the cloud region, and receives a precipitation of 537 $\frac{1}{2}$ inches during the south-west monsoon, from May to August inclusive. Col Sykes reported to the British Association, at its meeting in 1852, the rain-fall at these 127 places, which are between the parallels of 20° and 34° in India. According to this report, the south-west monsoons pour down during the three summer months upon this water-shed 29 $\frac{1}{2}$ inches of rain. The latent heat that is liberated during the condensation of the vapour for all this rain expands the air, causing it to boil over, flow off, and leave a low barometer, a diminished atmospheric pressure throughout all the region south of the Himalaya.

There is only one north-west monsoon found in the southern hemisphere. In the northern hemisphere the north-east trade-wind blows in the China Sea and in the Indian Ocean, in the East Indian Archipelago the west monsoon prevails, and when here the south-east trade wind blows as the east monsoon.

In the Java Sea, during the month of February, the west monsoon blows strong, almost continually, in March it blows intermittently and with hard squalls, but in April the squalls become less frequent and less severe. Now the changing commences, all at once gusts begin to spring up from the east—they are often followed by calms. The clouds which crowd themselves upon the clear sky give warning of the combat in the upper air which the currents there are about to wage with each other.

As the occasional showers which fall throughout the year in Britain are unknown in most Asiatic countries, the first particulars to attend to in examining their climate, are the season and the quantity of the periodical rains. It is these which regulate husbandry, and on which in many countries the temperature and succession of the seasons in a great measure depend. The most remarkable rainy season, is that called in India the south-west monsoon. It extends from Africa to the Malay peninsula, and deluges all the intermediate countries within certain limits of latitude, for four months in the year. In the south of India this monsoon commences about the beginning of June but it gets later as we advance toward the north. Its approach is announced by vast masses of clouds that rise from the Indian ocean, and advance toward the north-east, gathering and thickening as they approach the land. After some threatening days, the sky assumes a troubled appearance in the evenings and the monsoon in general sets in during the night. It is attended with such a thunder-storm as can scarcely be imagined by those who have only seen that phenomenon in a temperate climate. It generally begins with violent blasts of wind, which are succeeded by floods of rain. For some hours lightning is seen almost without intermission, sometimes it only illuminates the sky, and shows the clouds near the horizon, it others it discovers the distant hills, and again leaves all in darkness, when in an instant it re-appears in vivid and successive flashes, and exhibits the most objects in all the brightness of day. During all this time the distant thunder ceases to roll and is only silenced by some nearer peal, which bursts on the ear with such a sudden and tremendous crash as can scarcely fail to strike the most insensible heart with awe. At length the thunder ceases and nothing is heard but the continued pattering of the rain, and the rushing of the rising streams. The next day presents a gloomy spectacle, the rain still descends in torrents, and scarcely allows a view of the blackened fields, the rivers are swollen and discoloured and sweep down along with them the hedges, the huts, and the remains of the cultivation which was earned on, during the dry season in their beds. This lasts for some days, after which the sky clears, and discovers the face of nature changed as if by enchantment. Before the storm the fields were parched up, and except in the beds of the rivers, scarce a blade of vegetation was to be seen, the clearness of the sky was not interrupted by a single cloud, but the atmosphere was loaded with

dust, which was sufficient to render distant objects dim as in a mist and to make the sun appear dull and discoloured, till it attained a considerable elevation, a parching wind blew like a blast from a furnace, and heated wood, iron, and every other solid material, even in the shade, and immediately before the monsoon, this wind had been succeeded by still more sultry calms. But, when the first violence of the storm is over, the whole earth is covered with a sudden but luxuriant verdure, the rivers are full and tranquil, the air is pure and delicious, and the sky is varied and embellished with clouds. The effect of the change is visible on all the animal creation, and can only be imagined in Europe by supposing the depth of a dreary winter to start at once into all the freshness and brilliancy of spring. From this time the rain falls at intervals for about a month, when it comes on again with great violence, and in July the S.W. rains are at their height, during the third month they rather diminish, but are still heavy, and in September they gradually abate, and are often entirely suspended, till near the end of the month, when they depart amidst thunders and tempests as they came. Such is the S.W. monsoon in the greater part of India. It is not, however, without some diversity, the principal feature of which is the delay in its commencement, and the diminution in the quantity of rain, as it recedes from the sea. No trace of it can be perceived at Candahar. The north-east of Afghanistan, although much further from the sea than Candahar, is subject to the S.W. monsoon, and what is equally extraordinary receives it from the east. These anomalies may perhaps be accounted for by the following considerations. It is to be observed, that the clouds are formed by the vapours of the Indian ocean, and are driven over the land by a wind from the south-west. Most part of the tract in which the kingdom of Cabul lies, is to leeward of Africa and Arabia, and receives only the vapours of the narrow sea, between its southern shores and the latter country, which are but of small extent, and are exhausted in the immediate neighbourhood of the coast. India lying further east, and beyond the shelter of Africa, the S.W. monsoon spreads over it without any obstruction. It is naturally most heavy near the sea from which it draws its supplies, and is exhausted after it has past over a great extent of land. For this reason, the rains are more or less plentiful in each country, according to its distance from the sea, except in those near high mountains, which arrest the clouds, and

procure a larger supply of rain for the neighbouring tracts, than would have fallen to their share, if the passage of the clouds had been unobstructed. The obstacle presented to the clouds and winds by the mountains has another effect of no small importance. The south-west monsoon blows over the ocean in its natural direction, and though it may experience some diversities after it reaches the land, its general course over India may still be said to be towards the north-east till it is exhausted on the western and central parts of the peninsula. The provinces in the northeast receive the S.W. monsoon in a different manner, the wind which brings the rains to that part of the continent, originally blows from the south-west, over the Bay of Bengal, till the Himalaya mountains, and those which join them from the south, stop its progress, and compel it to follow their course towards the north-west. The prevailing wind therefore, in the region south-west of the Himalaya, is from the south-east, and it is from that quarter that the provinces in Bengal receive their rains. But when the wind has reached so far to the north-west as to meet with the Hindoo Coosh, it is again opposed by that mountain, and turned off along its face towards the west, till it meets the projection of Hindoo Coosh and the Soliman range, which prevent its further progress in that direction, or at least compel its clouds to part with the moisture with which it was loaded. The effect of the mountains in stopping the clouds borne by this wind is different in different places. Near the sea, where the clouds are still in a deep mass, part is discharged on the hills and the country beneath them, and part passes up to the north-west, but part makes its way over the first hills, and produces the rains in Tibet. In the latitude of Cashmere, where the clouds are considerably exhausted, this last division is little perceived, the southern face of the hills and the country still farther south is watered, and a part of the clouds continue their progress to Afghanistan, but few make their way over the mountains or reach the valley of Cashmere. The clouds which pass on to Afghanistan are exhausted as they go, the rains become weaker and weaker, and at last are merely sufficient to water the mountains without much affecting the plains at their base. The above observations will explain, or at least connect, the following facts connected with British India. The south-west monsoon commences on the Malabar coast in May, and is there very violent, it is later and more moderate in Mysore, and the Coromandel coast, covered by the mountainous countries on its west, is entirely ex-

empt from it or only receives it in the form of small showers. Further north, the monsoon begins early in June, and loses a good deal of its violence, except in the places influenced by the neighbourhood of the mountains or the sea, where the fall of water is very considerable. About Delhi, it does not begin till the end of June, and the fall of rain is greatly inferior to what is felt at Calcutta or Bombay. In the north of the Punjab, near the hills it exceeds that of Delhi, but in the south of the Punjab, distant both from the sea and the hills, very little rain falls. The countries under the hills of Cashmere, and those under Hindoo Coosh viz Pukhlee, Booner, and Swat, have all their share of the rains, but these diminish as we go west and at Swat are reduced to a month of clouds, with occasional showers. In the same month, the end of July and beginning of August, the monsoon appears in some clouds and showers at Peshawar, and in the Bughush and Khuttuk countries. It is still less felt in the valley of the Cabul river, where it does not extend beyond Lughmann, but in Bayour and Punjora, under the southern projection, in the part of the Kafir country, which is situated on the top of the same projection, and in Teera, situated in the angle formed by Tukht-i-Sohman and its eastern branches, the south-west monsoon is heavy, and forms the principal rains of the year. There is rain in this season in the country of the Janjee and Toree, which probably is brought from the north by eddy winds, but whether that which falls in Bannoo and the neighbouring countries is to be ascribed to this cause or to the regular monsoon from the southwest is uncertain. The regular monsoon is felt as far west as the utmost boundary of Mekran, it is not easy to fix its limits on the north-west with precision, beyond a line drawn through the northern part of the table land of Kelat and the northern parts of Shoranbuk, of Pisheer, and of Zhobe to the source of the Koorum, it falls, however, in very different quantities in the various countries south-east of that line. The clouds pass with little obstruction over Lower Sind, but rain more plentifully in Upper Sind and Domaun, where these rains, though not heavy, are the principal ones in the year. On the sea coast of Lus and Mekran, on the other hand, they are arrested by the mountains, and the monsoon resembles that of India. In Sewestan the monsoon is probably the same as in Upper Sind and Domaun, in Boree it is only about a month of cloudy and showery weather, it is probably less in Zhobe, and in the

other countries within the line it only appears in showers, more precarious as we advance toward the north.

The second rain of Afghanistan to be noticed, is that which falls in winter and which assumes the form of rain or snow, according to the temperature of the place; it extends over all the countries west of the Indus as far as the Hellespont, and is of much greater importance to husbandry than the south-west monsoon, except in the few districts already specified, it is indeed the most considerable rainy season in all the countries except those included in India, it even appears in India but only lasts for two or three days about Christmas and though of some importance to the cultivation cannot always be relied on. Where it falls in the form of snow, it is the most important to agriculture, but where it falls as rain it is less, so than that of the spring, the inferiority of the quantity of the latter being more than compensated by the opportuneness of its fall.

The spring rain of Afghanistan generally falls at different times during a period extended in some places to a fortnight and in others to a month, it extends over Afghanistan, Turkistan. In most parts of India, some showers fall at the same season, and delay the approach of the hot winds, but have little effect on the cultivation. In other countries it is of the utmost consequence to husbandry, as it falls at the time when the most important crop is beginning to appear above the ground. Both this and the winter rain are said to come from the west.

The climate of Afghanistan varies extremely in different parts of the country. This is in some measure attributed to the difference of latitude, but still more to the different degrees of elevation of different tracts. The direction of the prevailing winds also materially affects the climate; some blow over snowy mountains, others are heated in summer, and rendered cold in winter, by their passage over deserts and other arid tracts of great extent, some places are refreshed in summer by breezes from moister countries, and some are so surrounded with hills as to be inaccessible to any wind at all.

The sun's rays evaporate from the Bay of Bengal, water enough to feed with N. E. rains, the western shores of this bay, and the ghauts range of mountains. This range holds the relation to these winds that the Andes of Peru hold to the south-east trade-winds, it first cools, and then relieves them of moisture, which they tumble down on the western slopes of the ghauts.

The south west monsoon comes from the

MONTH.

the initial numeral, thence to the 30th or completion, called poornam, thus, instead of the 16th, 17th, &c of the month, they say Sudi ekum (1st) Sudi doag (2nd) The mahomedans of Arabia, Persia and India, following the lunar changes, divide their year into twelve months viz

1 Moharriam	7 Rajab
2 Safar	8 Shaban
3 Rabi ul awal	9 Ramazan
4 Rabi ul akhir, also	10 Shawwal
5 " us sam	11 Zu ul kaida
6 Jamadi ul awal	12 Zu ul haya,
7 Jamadi ul akhir, also	
8 " us sam	

The mahomedans, like most others, have weeks of seven days, called shambah The following are the Persian names of the days Ek shambah Sunday Puj shambah Thursday Do shambah Monday Adma or Jumma Friday Si shambah Tuesday Shambah Saturday, Char shambah Wednesday

The Arabs distinguish their days or yom as first, second, third, and the mahomedan in British India, use terms partly of Arabic, partly of Persian, and partly of Sanscrit origin,

Aitawar Sunday	Jumrat Thursday
Ph Monday	Juma Friday
Mangal Tuesday	Haftah, or Awal Haftah, Saturday
Char shambah Wednesday	

The following races designate the months of the year by terms derived from one source,

Bengali	Canarese,	Gujarati	Hindustani	Telugu	Tamil
Chaita Basakh	Chaita Vaishakha	Chaita Vaisak'h or Vaishak'h	Chait Bysakh	Chaiti Vashakh	Chytram Vyaso
Jyest'h Asar'h	Jestha Ashadha	Jeth, Ashad or Asad	Jeth Asar'h	Jyesth Ashad'h	Ani Adi
Shraban Bhadra Ashwin	Shravana Bhadrapada Aslvin	Shrawan Bhadariso Ashwan, Asbo, Ashwin	Swan Bhacun Asan	Shrawan Bhadrabad Ashwin	Aran Paratasi Arpasi
Kartik Agrahayan or Maga'susha	Kartika Magashura	Kartik, Kartak Magashai, Magashush	Kartik Aghan	Kartik Magashush Margah	Kartiga
Pushya Magh Phalgun	Pushya Magh Phalgun	Posh Magh Pagan	Push Magh Phagun	Push Magh Phalgun	Tye Mausi Pungun

MOOLA A river of Beluchistan, about
150 miles long, rises a few miles S of Kelat,
runs South-easterly, about 80 miles, north-
easterly, and easterly and is ultimately ab-
sorbed in the desert of Shikarpore The
Moola or Gundava Pass winds along its
course

MOOLA PASS or Gundava Pass of
Cutch Gundava, in Lat 28° 10,' lon 66°
12', to lat 28° 24,' lon 67° 27' is about 100
miles long it has open spaces, connected by
defiles Bapow, is 5,250 ft, Peesee Bhent,
4,600, Nurd, 2,850, Bent-i-Jah, 1,850, Kul-
lai, 750 ft Descent, 4,650 ft, average 16 ft
per mile Water abundant Practicable for
artillery In 1839, an Anglo-Indian de-
tachment marched through it It is preferable
to the Bolan Pass in a military point of view
The Moola is the southern pass through
the mountains of Sahiawan near Gandava
The height of the Sahiawan range varies
The greatest altitude is attained at Kelat,
about 7,000 feet, where the climate is Euro-
pean, southward it rapidly decreases, until,
in the province of Lns, the elevation is but
a trifling degree greater than that of Sind
It decreases also northward, the height of
Quetta being about 5,900 feet This
elevated district is composed of a suc-
cession of mountain ranges, which, rising

from the plains of Kutchee and valley of the Indus, tower one above the other in successive steps, until, having gained their maximum, they subside in lesser and lesser ranges westward. Their general direction is from N N E to S S W, and this uniformity of strike is wonderfully preserved throughout. The mass is broken through at two points, viz by the Bolan pass at its northern extremity, and by the Moola pass near Gundava. Here the ranges are twisted out of their original direction, and run in a N N W manner. Through these two great channels the principal draining of the country is effected, producing the Bolan and Moola rivers. It was through this pass that Cateus travelled, when he left the army of Alexander.

MOOLI, a river that joins the Moola near Poonah, forming the moola-mooli river.

MOOLTAN, is a large trading city, the capital of a province of the same name in the

Punjab. It is built near the left bank of the Chenab, in L 30° 9' N. and L 71° 7' east. The Mooltan district is, on the whole, an arid, sandy country, about 110 miles in length and 70 in its greatest breadth, and is comprehended between the Sutlej, there named the Ghaira, the Ravi and Chenab. Mooltan and Tatta were the ancient seats of the ancient Balla or Balli-kaputia race, and to the present the blessing or byrd of the bards is Tatta-Multan ka Rao. At an interval of 1300 years, two conquerors, Alexander and Mahmud, were opposed by a race of this name. In A D 1000, Mahmud entered Hindustan but in the course of eight years, he made no further progress than Mooltan. The people of Mooltan, who were the Malli, and Cathari (that is the Khatry or Rajpoot tribe) of Alexander, must have preserved their ancient spirit, to be able to oppose, for so long a time, such formidable armies headed by so furious an enthusiast as Mahmud. In 1008, we find the confederate hindoos defeated, and Mahmud's first essay towards effecting the downfall of their religion, was the destruction of the famous temple of Nagarkot, in the mountains bordering on the Panjab country. His next expedition, being the sixth, was in 1109, when Tannasar, a more celebrated place of hindoo worship, on the west of Delhi, experienced a like fate with Nagarkot, and the city of Delhi itself, was taken at the same time. In 1018, he took Kanoj, and also destroyed the temples of Matra, or Matura (the Methra of Pliny). His twelfth expedition, in 1024, was fatal to the celebrated temple of Somnath, in the peninsula of Guzerat adjoining to the town of Pattan, on the sea coast, and not far from the island of Diu, now in the hands of the Portuguese. Mooltan city was taken by storm by the British Indian Army on the 2nd January 1849. The chief products of the Mooltan district consist of cereals, cotton, indigo, sugarcane, saltpetre, alkali or sujje, ghee and wool, some of which commodities are also largely imported from other places, the surplus of wheat finds its way to Sukkur and Kurrachee — *Ann Ind Adm Vol XII p 106 & 10, Rennell's Memoir p 14*. See Katti, or Kattyawar.

Luna,	IT	LIT	SP	An,		TURK

In hindoo mythology, the moon is fabled to have been married to the twentyseven daughters of the patriarch Daksha, or Aswini, and the rest, who are in fact personifications of the lunar asterisms. His favourite amongst them was Rohini, to whom he so wholly devoted himself as to neglect the rest. They complained to their father, and Daksha repeatedly interposed, till, finding his remonstrances vain, he denounced a curse upon his son-in-law, in consequence of which he remained childless and became affected by consumption. The wives of Chandra having interceded in his behalf with their father, Daksha modified an imprecation which he could not recall, and pronounced that the decay should be periodical only, not permanent, and that it, should alternate with periods of recovery. Hence the successive wane and increase of the moon. Rohini, in astronomy, is the fourth lunar mansion, containing five stars, the principal of which is Aldebaran. Hindoos have long been aware of the astronomical facts of the moon's deriving its light from the sun, and by its positions forming the days of the lunar month, on which particular ceremonies are to be observed. In the latter case it is supposed to move in the Mandala, the sphere or orbit of the sun, and when in conjunction, as at the new moon or Anavasya, funeral obsequies are especially to be celebrated. According

to mythological notions, also, the moon is the grand receptacle and storehouse of amrit or ambrosia, which it supplies during the fortnight of its wane to the gods, and on the last day to the Pitri or deified progenitors. As personified, in hindooism, the moon is the father of Bndha and grandfather of Pururavas, as already shewn. The half-moon, as frequently noticed, is worn by Siva upon his forehead. With the Rajpoots, as with the Scandinavians, the moon is a male divinity. The Tatar nation also considered him a male divinity, like Adonis. The moon has, in many nations, been considered to exercise an influence on the body, producing and modifying diseases, and has played an important part in the development of the character of nations and in determining the destinies of the human race. New moons, and full moons and moonless heavens at the conjunction have been kept with ceremonies or fastings. Eclipses whether of the sun or moon have been looked on as evidences of divine displeasure, the influence of the moon on marriage and child bearing was considered great. According to Eggede, the Greenlanders believe that the moon visits their wives now and then, and that staring long at it, when at its full will make a maid pregnant. Amongst the Jews, according to Rabbi Abiavanel, the full moon was believed to be lucky and the other phases disastrous, and the belief of the Greeks and Romans was similar. The day of the full moon was by the Greeks the best for marriage. Hesiod, Aristotle, Lucius, Horace, Pliny, Galen, Lord Bacon and others have all made similar notices. *Winslow on Light—Padma Purana Swarga Khanda Section 11 Hindu Theatre Vol I pp 229, 234 Tod's Rajasthan Vol I p 596*

MOON, JAP a crest, or arms, of which the Japanese are as proud as any European noble. It is worn on their dresses, their armour, before their gateways and wherever it can be seen before the Government-house there is generally spread a grass-tree or linen-cloth, which means "No admittance except on business." the "moon" or crest has much the appearance of a clover leaf, and is the "moon" of government. *Hodgson's Nagasaki*, p 16, 22

MOORCROFT, WILLIAM, a veterinary surgeon of the Bengal army who travelled in Central Asia, and after some days illness died at Audkhur. He lies interred outside the walls of Balkh. Author of Journey to lake Manasarovara, in Little Thibet. A cold permission was Mr Moorcroft's only incitement beyond the stimulus of a speculative mind and an enterprising disposition. His first attempt, which was made by way of Chinese Tartary, has been long the property of geographers, having been published in the twelfth volume of the Asiatic Researches. In this journey he was the first European to cross the Himalaya, and he made his way to the great plain between that and the Kuen-lun chain, the situation of the sources of the Indus and the Sutlej, and

of the two remarkable lakes of Ravan and Manasa. Besides the natural difficulties of the way, he had to elude the vigilance of the Nepalese, then masters of the Himalaya, and who were on the eve of that war with the British which transferred the snowy mountains to the latter. Mr Moorcroft had also to conciliate the Chinese authorities beyond the Himalaya, and in spite of all obstacles, and of sickness, induced by exposure and fatigue, he accomplished his purpose, ascertaining not only the valuable geographical facts alluded to (the situation of the sacred lakes of the Hindus, and the upper course of two important rivers), but the region, also, of the shawl-wool goat, and opening a way for the importation of the wool into Hindustan, and finally into Britain.

He was the originator and the principal of the journey and enterprise. He was a native of Lancashire, and was educated at Liverpool for the profession of a surgeon. Upon the completion of the usual course of study, however, his attention was diverted to a different pursuit, and he finally settled in London as a practitioner of veterinary surgery. After traversing the mountains, Mr Moorcroft and his party arrived safely at Le by a route on which no European had preceded them, and on his way he first determined the direction of the upper parts and the sources of two of the three great rivers of the Panjab,—the Beyah, Vipasa or Hyphasis, and the Chandiabghaga, or Chenab, also the Acesines or Ab-i-sin. A very small portion of this tract, or the southern part of the hill states of Kahalur, Sukhet, and Kotoch, were crossed by Forster, but in a condition of personal restraint and danger, which left him little leisure for observation. About two centuries earlier (1624) the Jesuit missionary, Andrada, appears to have made his way from Sinagai to the north of the Himalaya into either Ladakh, and in the beginning of the eighteenth century, (1715,) the missionary, Desideri, entered Kashmir by the Pu Panjal pass, and thence proceeded to Lh'assa through Ladakh. The route from Kabul to Bokhara was, at the time when it was travelled by Mr Moorcroft, new to European investigation. Goetz, who travelled from Kabul to Kashgar, and thence to China, in 1603, passed over a portion of it, but it is difficult to identify all the places which he names, and his account is concise and imperfect. "Before I quit Turkistan," Moorcroft writes from Bokhara, "I mean to penetrate into that tract which contains probably the best horses in Asia, but with which all intercourse has been

suspended during the last five years. The experiment is full of hazard, but *le jeu vaut bien la chandelle*. His life fell a sacrifice to his zeal. At Andh'ko, where he spent some days in effecting purchases, he was taken ill with fever, and died.

Mazai is the place where Mr Thebeck, the last of Moorcroft's unfortunate party, expired. A Hajee attended him on his death-bed, and he is laid in a small burying ground westward of the town, under a mulberry tree—*As Res*, 1816, vol. xii 375 *Travels in the Himalayan Provinces*, Lond 1841, 2 Vols Edited by Dr H H Wilson, *A Journey to Lake Manasarovara, in Asiatic Res* vol. xii *Calcutta*, *Moorcroft's Travels* Vol. 1 pp xix, xxxv, xlv, xlvii, xlx.

MOOREED, a disciple, (man or woman)

MOORE, Dr Thomas Horsfield and Mr Frederic Moore's Catalogue of Birds in the India House Museum appeared in 1854, 1856 and 1858. Dr Horsfield was one of the earliest naturalists labouring in India though the extent of his labours, in Java and Sumatra, is unfortunately but little known. His researches in Java and the neighbouring islands began in 1802, and were continued till 1819. During that time he collected upwards of two thousand species, the most curious and interesting of which have been published by Messrs Brown and Bennett, in the '*Plantæ Javanicæ maiores*' one of the most profound and accurate botanical works of the day, and one most important for the Indian botanist to study with attention. In 1851, Dr Thomas Horsfield published a catalogue of the mammalia in the India House Museum. In 1851, 1858, 1859, Dr Horsfield and Mr Frederic Moore published a catalogue of the Lepidopterous insects in that institution, and, in 1859, Mr Moore published the notices of the Bombycidae, of the genus *Adolia* and of the silk producing genera—*Mr F Moore and Dr T Horsfield's catalogues*, *Dis Hooker and Thomson*.

MOORLIUB, a river in the Gyah district of Bengal

MOORIES are blue cloths principally manufactured in the districts of Nellore and at Coonatoon in the Chingleput collectorate of Madras. They are 2 cubits in breadth, and 28 long and sold at from 2 to 7 Rs each, according to their sizes. They are largely exported to the Straits of Malacca.

MOORMAN a designation, in Ceylon, for a person of a race believed to be of Arab descent, the establishment of a mahomedan colony before the close of the seventh century is alluded to by Beladeni or Ahmad in a chronicle of the Arab conquests in Europe and Asia. They are shiah mahomedans. Their priests, who are elected by them from those of their people who are most deeply versed in the Koran, officiate in the mosques and deliver their discourses in Persian. In their funerals, the corpse, after being washed and anointed by the lebbe and sprinkled with powder of sandalwood, is borne in a coffin without a bottom (its place being supplied by plaited tapes), and carried on a bier decorated with flowers, which are afterwards planted on the grave. The procession is accompanied by mourners, who chaunt the funeral cry of the mahomedans.

The Moormen of Ceylon seem of similar origin with the Moplah of Malabar and

MOOSHA

the Labbi of the South of the Peninsula Throughout the peninsula, the uneducated of the European community continue to designate every mahomedan as a moorman — *Journal Asiatique Pen et Mars*, 1845 — *Fragmens Arabes et Persans relatifs à Inde*, *Fragm*, V, p 156, in *Tennent's Christianity in Ceylon* p 35 36.

MOOSTUNG, a principal and most extensive valley of Beluchistan, situated to the south of the valleys of Quetta and Kanhee. It extends from about $29^{\circ} 30'$ to near 30° N lat., and its eastern boundary is nearly defined by the 67° of E long. It is therefore about 40 miles in length, and varies in breadth from 5 to 8 miles, spreading out towards its upper end, and being gradually constricted towards its lower or southern extremity. It is bounded by parallel ranges running N N E by S S W of medium height, probably from 500 to 800 feet. The range to the eastward is pierced by a pass leading to the Dasht-i-be-Daulat. See Kelat.

MOOSTUSSA, Moosubba, Moosuddus. AR HIND. Varieties of magic squares.

MOOSUL, is situated on the right bank of the river Tigris, its population and trade have greatly diminished since the time, prior to the discovery of the Cape passage, when it was the thoroughfare for the caravans, between Europe and India. It formerly enjoyed a high reputation for the manufacture which derives its name from the town and is known in France as mousseline and in English as muslin. At a short distance is the mound and village of Nabbi Yunus, in which is a mosque, which covers the supposed tomb of the prophet Jonah.

MOOTTATI TEL a tribe of agriculturists from Telingana settled at Bellary, in the borders of the Canarese and Teling districts. The agricultural races there, are, the sudia village authorities, viz Packinattee, Moottatee, Vellanattee, these are styled Reddy in Tamil and Telugu, or by the Mahatta term of Potail. They collect the Government rents. They claim to be the true owners of portions of the land in Southern India. Other husbandmen of the sudia caste, are the Peracoonty Capooloo Goongeddy Laneeka wanloo, and Cudeywaklee wanloo. The women of the last named caste dress then hair in a bunch on the right side of their heads.

MOOTTEE, TAM Stychnos nuxvomica

MOOTTHEE BANDHNA, HIND crawling on all fours

MOOZDULUFFA, an oratory between Arafat and Mina near Mecca

MOPEA, in Cheria punji near it run the rivers Bor Neigua, Bor Sonu and Hoor-hoon.

MOP-GHA, a tribe who occupy the range of hills between Thonk-ye-khat and Kannie Creeks, skirting the Bghai race on the west. See Karen.

MOPLA, an energetic, vigorous, progressive and prosperous community and in considerable number, in a large portion of Malabar, they form half the populations, and in the Malabar district their total number by census is not short of half a million, they are very numerous in Travancore and are numerous in Canara. The Mopla have a large share of Arab blood, are supposed to be from intercourse between Arabs and the Tier women, and are a fine, stout, manly, good looking, race, sturdy, independent, intelligent and educated. They are industrious, and money makers, in some respects are perhaps, in their industrious habits, the best population to be found anywhere in India. They have comfortable, neat, two-storied houses and homesteads, they have most of the trade of the western coast in their hands, and are rapidly acquiring a larger and larger share in the land. They do not often seek public service. The term Moplah, is supposed to be derived from the Malayala words, Mapillah, literally, mother's son. The mahomedan moplah are sometimes called Jonakan mapillah (from Yavana, Greek) to distinguish them from the Nasrani (Nazarine) mapillah, the Nestorian Christians of

Malabar The mahomedans on the S E parts of the peninsula usually receive and accept the honorary designation of Labbi, from their habit of using in conversation the Arabic word "labek," may it please you, I beg your pardon, when not apprehending a remark. The Mopla in the South-western coast of India, and Ceylon, and the Labbi from the S Eastern coast of the peninsula of India are said to have had a similar origin, viz, from Arab fathers and Indian mothers. On several occasions since that part of India came into the possession of Great Britain the Mopla have required to be coerced, and are known to possess much fanatical zeal, but it is generally supposed that again in disputes have been a prominent cause of their outbreaks. The Mopla of North Malabar, although mahomedans, follow the rule, as to property, of *decimus a Mores*, the *Mummukhi riyam*, having, in this respect conformed to hindu usage, in the times of the ascendancy of the hindus. The Mopla also take the wife of a deceased brother.

The Chohi Moplah or Labbi of the S E of the Peninsula are called by the Tiling, Jonangi, Zouangi, Jonigu, Jonikari. The intercourse with the mahomedan merchants and seamen and the women of western India seems to have been from the most ancient times. Abundant writing A D 916 mentions that the more devout merchants of Siraf, where young men were on board, avoided sending their ships to Ceylon, as the women were very licentious, and merchants would, when newly arrived, make advances to the daughter of a king and she, with the knowledge of her father, would go to meet him in some woody place. Besides the Mopla, there are, in the Peninsula of India, following mahomedanism, distinct races. The most numerous are the offspring of the Arab conquerors, who have come through Persia and Hindustan, the Moghul race, designated "beg," and the Pathan or Afghan race, styled "khan", comparatively few in the peninsula of India, are all descendants of soldiers of the mahomedan armies, and these three races are still chiefly soldiers. The Moplah and the Labbi mahomedans are in considerable numbers on the extreme S W and S E of the peninsula, and are all engaged in traffic as merchants, as shopkeepers, or as pedlars. The Nao-anti mahomedans are engaged in civil avocations, and also the Bohra merchants and shopkeepers. The Nao anti differ by very marked characters from all around them. The Labbi are a tall and large made race, of a deep black colour. Their usual dress consists of a dhoti

or lungu wrapper round the loins. They are largely engaged in mercantile business and as pedlars. They use the Tamil alphabet, have a Tamil Koian, and speak and read the Tamil language only. Their name is derived from the Arabic word "labek," may it please you, and the people are usually supposed to be descendants of trading or sailor Arab fathers with mothers of India.

The Bohra are found in the Rajpoot states, on the N western coast of Peninsular India and are gradually extending to the south. They represent themselves as to their religious sect to be the descendants of the followers of the Sheikh-ul-Jabl, the celebrated old man of the mountain. They call themselves Ismuh, acknowledge an Aichmandite or religious chief, they principally follow mercantile pursuits, and are a robust, active, intelligent mercantile race, they are scattered all over the country, but are found principally in Guzerat, and the adjoining provinces of Cutch, Sind and other parts of the Bombay presidency. They are a peaceable, inoffensive body of men.

The Nao-anti are a small non-military race who, but for a slightly zanthous tinge, would have an almost English fairness. They are called Nao-anti, new comers, and are said to have emigrated from Arabia about three hundred years ago, and are now to be found in considerable numbers in Southern India. They are slender, fair, men with very fair handsome women, and are engaged in civil avocations, never becoming soldiers. They say that they came from Arabia to the Konkani. The Nao-anti are supposed by some to have been sea-shore Arabs, they seem to the editor to be Persians. Indian mahomedans assert that they are the descendants of women and children from Arabia whose men were killed on being detected in an attempt to rob the tomb of Mahomed and their wives and children were sent off in a ship which landed on the western coast, but this is doubtless a story got up to vilify a race.

The Moplah are generally men of good stature, and considerable strength, and when young are not wanting in good looks. They wear a beard and moustache, cut tolerably close, and little or no hair on the head. A linen skull cap, covered by a varied colored topi, protects the crown, and with the richer members of the sect, a white and gold pugree is wound around the head also. A loose flowing chemise, with gold or colored threads worked round the borders, and a jacket of pink, blue, or elaborately embroidered cloth of gold with an under garment of scarlet or blue cloth, loose and short white cotton trousers, and wood-

en sandals, more or less handsomely decorated complete the Moplah's costume. He invariably carries a china folding umbrella, and wears a bunch of keys suspended by a string from his neck. In his hand, flung over his shoulder, or tied round his waist, a smart Madras cotton handkerchief is always to be seen. The Moplah are generally cleanly and well attired when they appear out of their houses and bazaars. Their women dress in blue and white cotton cloths, and on feast days are sometimes gorgeous to behold, with rings of brass, silver and copper, bracelets of blue, red, and black glass, tinselled wood and white metal, earrings of lead, silver, and pinchbeck and necklaces of a variety of materials. The poor Moplah women are generally very dirty in their habits, their dress foul and black, their heads un-combed and their miserable dwellings odoriferous and otherwise disgusting. They seem wretched, miserable, and hopeless indeed. But with the increased demand for labour, poverty and indigence is happily retiring, and in a few years the present tenants of mud hovels

The Tiar are mostly clean respectful and susceptible of kindness, and good words. Both men and women are generally handsome, with strong muscular frames, and plenty of walking and talking, and eating powers. They do not encumber themselves with large wardrobes, a white cotton cloth wound round the waist, and reaching to the knees, being only necessary for their full dress costume. The women sometimes carry a small piece of muslin over the shoulder, and draw it across the breast when a European approaches, but as white faces are not rare now-a-days, this habit is wearing out, and semi-nudity is the rule. A woman of easy virtue wears more decent apparel as a token of the laxity of her morals.

The extension of the mahomedan doctrines on the west coast took place in early times. According to Malabar records in the Arabic language some emissaries came here so far back as the reign of Cheramperumal, when mahomed was in his 57th year, and so entirely persuaded the emperor of the mission of their prophet, that he resolved to go in person to visit him. Cheramperumal died, however, on his journey, but not till he had taken care by letters which he addressed before his death to the rajahs of Malabar, that all freedom should be allowed the mahomedan teachers to propagate their religion, make disciples and build temples through the whole country. This they did with equal zeal and success, so that within

a few years their creed had struck deep root here. A Dutch writer, in the year 1721, remarks that the mahomedans, being like the St Thomas' Christians, born in the land, might be, in one sense regarded as natives of Malabar, but as they have mingled with other members of their faith, Mogul, Turk and Arab, who resort to the country for purposes of trade, they form in some sort, a distinct people. See India, Mapillary Polyandry. MOPLANG, or Moflong, L 25° 28', N, 91° 43' in the Khassia hills, about 15 miles N of the sanitarium of Cheira Punji. <i>umbellata</i> , <i>L</i>	Comtallum, S Concan
<i>vagans</i> , <i>Wall</i>	China

The bark and root of *M. tinctoria*, *M. citrifolia* in India, and *M. excelsa* in Burma, and the root of *M. ternifolia* in Mysore, are employed to form a very valuable red dye, which is fixed with alum. Most of the red turbans of Madras are dyed with the root of the Noona. The Karen's prepare their red dyes most usually from the roots of two or three species. The *M. citrifolia*, is cultivated by

MORINDA CITRIFOLIA

the Burmese for a dye, but the Karens more commonly use *Morinda exserta*, the indigenous species. The colour, though not brilliant, is far more permanent than many other colours. A species of *morinda* is often seen growing near Burman houses, which produces a fruit as large as a pullet's egg. It is a great favorite with the Burmese, and is served up in their curries. The most agreeably fragrant, flowering shrub in the Karen forests, is a species of *Morinda*. The flowers are small, in dense heads, like other members of the genus, azure, purple externally, but white within, and has only four anthers, like a species described by Jack which he found on the Malay Islands. Specimens of the bark and root of various species of *Morinda tinctoria*, *citrifolia* and *umbellata*, were exhibited at the Madras Exhibition of 1855, from different parts of Southern India and the Northern Circars. The quantity procurable is very large, and the dye appears worthy of the attention of practical dyers. *M. tinctoria* is usually grown as a prop and shade for the pepper vine and coffee tree. The coloring matter resides principally in the bark of the roots, which are long and slender, and the small pieces are the best, fetching 8s to 10s a maund. It is exported in large quantities from Malabar to Guzerat, and the northern parts of Hindustan, but seldom finds its way to Europe — *Roxb Wall Vogt. Buch Mason M E J R*

MORINDA BRACTEATA, Roxb

Rouch,	BENG	Yaiyoe?	BURM
Mhan bin ?	BURM		

A small tree, with large shining leaves native of Ganjam, the Andamans, the Philippines, Moluccas, common throughout the province of Pegu, and cultivated about phoungyee houses. Its wood, of a bright yellow colour, is found in the Bengal bazaars under the name of rouch, and is valuable as affording a bright yellow dye — *D. McClelland, M. Robert Brown Vogt*

			TEL

This small tree is common in Kotah and Boondie, grows in the Madras Presidency, is much cultivated in that of Bombay, and grows in Pegu, Cochinchina and the Mo-

MORINDA CITRIFOLIA

lucas It is not a common tree in the Bombay forests, but is more frequent about the villages. The wood is of a deep brownish yellow, is easily worked is used for common purposes little, if at all, inferior to *Nauclea cordifolia*, but the tree is much smaller. Mr Rohde has seen trees of this wood nearly two feet in diameter. It makes tolerable planks, but appears never to be so used on the Bombay side, except for door shutters and such like. A scarlet colouring matter is procured from the roots and bark and used for dyeing handkerchiefs, turbans, &c. It is employed, also, to assist more expensive dyes in giving a red colour to yarn and cloth—the red thread used in carpet making is entirely dyed with it. The process of dyeing red yarns in the Circars is well described by Heyne. In all the Asiatic islands, *M. citrifolia* and *M. tinctoria* are extensively used as a dye stuff for giving a red colour. This is usually grown as a prop and shade for the pepper vine and coffee tree. The coloring matter resides principally in the bark of the roots, which are long and slender, and the small pieces are the best, fetching 8s to 10s a maund. It is exported in large quantities from Malabar to Guzerat, and the northern parts of Hindostan, but seldom finds its way to Europe. The small white flowers have a very sweet scent and the tree would thrive well and be ornamental in compounds. In Coimbatore, Nonna maiam, *Tam*, is the proper Tamil name for the *Morinda citrifolia*, but *Morinda umbellata*, a climbing plant, and hence unfit for use as a timber, has the same Tamil name.

The red dye obtained from the roots of the *Morinda citrifolia* is equal in every respect to that of the sapan wood, and is in general use with the natives for dyeing the yarn of the native cloths, both silk and cotton, and with the exception of some specimens of Java dyes obtained from the same tree, better single colours of the kind are rarely seen. It must be borne in mind in relation to such a comparison, that the use of mineral mordant in the native process is unknown, and with the exception of weak ley made from the ashes of some of the plants of the jungles, no other application is made beyond the simple solution of the extract from the wood itself. The bark and root of this *Morinda* is used in the same manner as that of the *M. umbellata*. Most of the Madras red turbans are dyed with this substance. The plants come to maturity in three years. The roots are then dug up and sorted into three kinds, according to the fineness of the fibres. The fibres are then cut and beaten

MORINDA TINCTORIA

down well, and then ground to powder, which latter is used for the dye — *Dis Wright, Roxb, Voigt, Gibson & Clegghorn, McClelland Irvine, Gen Med Top p 182, M Robert Brown, M Rhode, Simmonds Cat Fr 1862 Thunberg's Travels, Vol II p 290*

MORINDA EXSERTA, Roxb

Bun uch	BENG	Togari mogilli	TEL of
Mhan bin?	BURM	the Godavery	
Myau	"	Mogilli	T.L. of Circars
Nya?	"		

A small tree of the Circars, of Bengal, Burma and Burmah, its yellow, hard and useful, wood, is fit for fancy work, and does not warp. In Pegu, *M biacteata* and this are both small trees, only found about Phoung-ye houses, in a cultivated state *Roxb Voigt, Captorn Beddome*

MORINDA MULTIFLORA

Aal of NAGPUR | Achmal of BERAR

Much cultivated about Nagpore for its dye. Cultivated through Rajpootanah, principally near Kotah, and all over Harowtee. The plant is allowed to remain three years in the ground, and then the roots are taken up and dried. The dye is a fine turkey red and is very plentiful. One maund costs sixteen rupees. Is not used medicinally *Roxb, Rohde M S S Irvine Gen Med Top p 125*

MORINDA TINCTORIA, Roxb

Al,	BENG HIND	Maddi chettu,	TEL
Uch,	"	Mulugu chettu,	"
Ach,	"	Luagru,	"
Uchyuta,	SANS	Togaru,	"

A small tree, supposed to be the same as *M citrifolia* in its wild state. Extreme height 36 feet, circumference $2\frac{1}{2}$ feet. Height from ground to the intersection of the first branch, 10 feet. Its green fruit is pickled or eaten in curries. It is in flower and fruit the greater part, if not the whole, of the year. It is pretty common in every part of India, is largely cultivated at Ganjam, Gumsui, Boondie, Kotah, Guignon, Philbeet and Mewar. The woods of all the species are beautiful, hard and durable, and excellent for gun stocks. That of this species, possesses all these qualities, is variegated and white, and is employed for gun stocks in preference to all other kinds. The bark or the roots is used to dye red, the color is fixed with alum, but it is neither bright nor durable. In some parts of India, it is cultivated for the sake of the roots. In the Circars the dyers use the bark of the fresh roots bruised and gently boiled in water for a short time. The cloth or yarn is prepared in a cold infusion of the powdered gall of *Ternahia chebula*, in milk and water, it is then dried and moistened with alum water, and again dried, and receives from the

MORINDA UMBELLATA

above decoction, a pretty bright, but fugitive red. *Di Livino* says the root is extensively exported from Ajmecc as a red dye. The plant is not allowed to shoot up into the bush, but is dug up the third year after planting. The flowers are very fragrant — *Di Roxb Irvine Med Top of Ajmecc, p 182, Voigt, M Robert Brown M Rhode, M S S*

MORINDA TOMENTOSA, Heyne

M mudia, HAN | Manjanati, MATEAL

A very common Travancore tree, attaining a height of 20 to 30 feet. Its timber is of a yellow colour, and is used for various economical purposes. The inner wood of the older trees furnishes a dye — *Useful Plants*

MORINDA UMBELLATA Linn

Patangi viksha,	CAN	Nana miam	TAM
Chota Al,	DUK	Mulu gudu,	TEL
Mang kudu,	MARAY		

A trailing creeping plant, grows in the western parts of the peninsula of India, at Comtallam in Malabar and in the S. Concan. The roots yield a yellow dye, and in Cochin-China, with the addition of sappan wood, a red dye — *Ainslie Roxb Wright, Drury*

Morinda tinctoria, *M citrifolia*, *M umbellata*, in India, and *M exserta*, in Burmah, are all employed to form a very valuable red dye, which is fixed with alum, and Buchanan mentions another species, the *M ternifolia* in Mysore, the root of which is used for a similar purpose. Most of the red turbans of Madras are dyed with the root of the Noona tree. The Karens most usually prepare their red dyes from the roots of the morinda tree, and at least two or three species are used for this purpose. The *M citrifolia* is cultivated by the Burmese for a dye, but the Karens more commonly use *Morinda exserta*, the indigenous species. In many parts the roots of the *Morinda umbellata* are employed instead of chay-root in dyeing cotton yarn red. The colour is neither so bright or so durable. *Di Heyne* thus describes the process. Take $3\frac{1}{2}$ lbs of white cotton yarn and soak it in $1\frac{1}{2}$ lb of gingi oil, a strong dye made of the ashes of the milk hedge, and the yarn steeped in it for four nights being dried in the sun during the day, it is then washed in blackish water and dried in the sun.

Five seers (kutchu $13\frac{1}{2}$ lb 2) of togara root finely powdered are put into a pot of water together with the yarn and kept all night over a fire of cowdung, in the morning it is taken out and dried in the sun, the same process is repeated for two successive

days and nights which completes the process. It is probable that a superior dye might be obtained if the same meteties were observed as in dyeing with chay-root. In Sumatra the outward parts of the root being dried, pounded, and boiled in water, afford a red dye, for fixing which, the ashes procured from the stalks of the fruit and midribs of the leaves of the cocoanut are employed. Sometimes the bark or wood of the sahang tree is mixed with these roots. Maissen says that another species of bangkuda, with broader leaves (*Morinda citrifolia*) does not yield any colouring matter, but is commonly planted in the Malayan Peninsula and in Pulo Penang, as a support to the pepper vine—*Maissen's History of Sumatra*, p 95 *Royle Arts, &c of India*, p 481, *M E J R*, *Tomlinson*, p 281, *Williams' Middle Kingdom*, Vol II, p 106, *Fortune's Res among the Chinese*, pp 146, 167, *Ure's Dic of Arts*, *Rohde M S S*

Sajna, Sanjana,	HIND		

This species of Moringa is useful to the countries in which it grows, the leaves, root, flowers, seed vessels or fruit, gum, wood, bark, and oil, are used by the people of India

and by Europeans. The tree is very abundant all over British India, Burmah and the Malay peninsula. The leaves, flowers and seed vessels are used in curries. The roots have precisely the flavour of horseradish, and seem identical in chemical composition, and in India are substituted for the true horseradish by Europeans. The gum and bark are used in native medicine, the oil is aperient, and much used by the natives in gout and rheumatism, the native doctors prescribe the green root as a stimulant in paralysis and in intermittents, in scruple doses, and use it also in epilepsy and hysteria. The seeds are also used internally by the native practitioners, for their pungent and stimulating virtues. In Jamaica the wood is used for dyeing a blue colour. An oil is obtained from the seeds possessed of the same qualities as the oil of ben, the product of the *M aptera*, a native of Sennar, Cano and Palestine, much used by perfumers and by watchmakers, as it neither grows rancid nor freezes readily. The delicate perfume of flowers are often retained by the ben oil, by pouring it over the flowers, or strewing layers of the flowers for about four hours over cotton soaked in the oil. In the West Indies the oil is used as a salad oil. According to Mr Faulkner, ben oil is also prepared from the *Guilandina moringa*, a tree which he says grows in Ceylon, Arabia, Egypt and Ethiopia. A compound infusion of *Sobun-juna* represents a similar infusion of horseradish of the London Pharmacopœia. A compound spirit of *sobun-juna* is stimulant in a dose of from two to four fluid drachms in water. It is obtained in a large quantity, does not dissolve in water, resembles in some respects gum tragacanth, for which it may probably be substituted. It exudes freely whenever an incision is made in the bark. It is used by the natives in head-ache mixed with milk and rubbed on the temples, and is also employed as a local application for pains in the limbs—*Dis Royle, Amstie, Roxb Mason, J L Stewart, Voigt* 78 *M E J R Riddell O'Shaughnessy, M Jaffrey, Cal Cat Ex* 1862 *M E J R Beng Phar* pp 304, 414

MORLI, MAHR A god devoted to the hindoo gods, who never marries but awaits a summons. The Morli of the Mahatta people is identical in character with the Jogini and the Basavi of the Tiling people. Basava is a name of the vahan or conveyance of the god Siva, the linga basavi are

MOROCARPUS LONGIFOLIUS

women who been dedicated to the lingam, the garuda basavi have been dedicated to garuda, the eagle vahana of Vishnu, but they are alike common. There are few instances of the brahmin, the chetiya vaisya or sudra races devoting their children, but amongst the non-arian races in the large towns it is common, but done as a means of prostitution without shame. The victim is taken to the idol, in some parts to a knife, to whom she is married by a ceremony and the deity is supposed to take possession of her. About Oomraoti in Berar young men are similarly devoted and styled Wagni. See Muir.

MORMON A religious sect in N America practising polygamy. Towards the year A D 1870, their organization in the territory of Utah was sustaining shocks which must end either in its being entirely remodelled or overthrown, they are no longer persecuted as they were when they were driven from Missouri and Illinois, and compelled to seek a new home far remote from angry and cruel men. Neither did they now persecute the gentiles as they did after they had established themselves in Salt Lake City, and thought themselves powerful enough to defy the authority of the Executive Government, the Chief Justice of Utah refused to admit to the privileges of citizenship a Mormon living in a state of bigamy, and openly violating the law of the United States. The Legislature of Utah had sanctioned the alienation of the public domain as a reward for good and obedient Mormons. The legality of all these gifts of land is now denied. Law Courts are thus affecting a silent revolution by simply administering the law, though Mormonism may survive, the fate of polygamy is sealed.

MOROCCO, a kingdom in the north of Africa, ruled by a mahomedan sovereign, it has a population of about eight millions

Berber	2,300,000	Negro and	
Shellok...	1,450,000	Abid	120,000
Moor	3,550,000	Christians	300
Arab	740,000	Renegades	200
Jew	340,000		

The Arabs of Morocco, are the Moors of Spain, the Saracens of France, tall graceful sons of the Arabian desert, courteous, brave, hospitable and confiding,—descendants of the conquerors, who, in the first ages of the hijrah, propagated the religion of Mahomed, crossed the straits of Gibraltar, destroyed the Gothic chivalry, reigned in Spain for 700 years, invaded France, devastated Italy and pillaged the suburbs of Imperial Rome. When the last Arab king submitted to Ferdinand and Isabella and the Moorish palaces of Grenada were surrendered to the christians, the old conquerors went back to Africa and resumed their nomadic life. In Tripoli, the Arab has monopolized the country. In Tunis the native re-appears in a smaller proportion, and in Morocco he is very scarce. The Berber and Shellok are untamed warlike tribes dwelling in the mountains, when possible, rovers of the sea, claiming fanciful origins, but impatient of any subjection, they are the same race whom the French call Kabyle and Zouave. The Moor are little idle men who grow fat from indolence they are lowlanders, traders, dwellers in cities, avaricious, perfidious, cowardly, cunning and insolent. The Riff dwellers of Kabhya, Cape Ties Foreas, correspond to the Arab Sahah on the Red Sea coast, the name Riff being evidently from rifa, "a bank." The towns of Mequenez on the N and Morocco on the South, are the chief cities. See Snbhalli Semitic races

- scandens*, Wall China
- serrata*, Roxb China
- tatarica*, Pall Cultivated in British India
- undata*, Buch Patna

The genus *Morus* is numerous in species and abounding in individuals, many of which are cultivated on account of their fruit, but still more for their leaves as food for the silkworm. The bark of the white mulberry seems from very early times to have been made into paper in China, Marco Polo informs us that "the Grand Khan causes the bark to be stripped from these mulberry trees, the leaves of which are used for feeding silkworms, and takes from it that thin rind which lies between the coarse bark and the wood of the tree. This being steeped, and afterwards pounded in a mortar until reduced to a pulp, is made into paper, resembling that which is made from cotton." The bush cultivation of the mulberry in Bengal, for feeding silk-worms, consists in planting cuttings, which, as they grow, are cut down about four times in the year, in order to produce young leaves for the successive brood of silk-worms. Very satisfactory half-stuff is obtained from the bark of the stems. The bark separates when the cut stems are steeped in water, and when pounded up, the greater part of the mucilaginous matter passes off, leaving a mass, having much of the good qualities of linen rag half-stuff. In China, the leaf of the common mulberry is the principal object of its culture, but the fruit is eaten, and the wood burned for the lamp-black used in making ink. *Morus alba*, and *Morus nigra* grow equally well in the Deccan, the white, growing to a very large tree, shedding its leaves before the hot season. The red mulberry bears fruit in the rains, as well as the black. Silk worms may be fed on its young fresh leaves although the leaves of the white are preferred, it grows from seed or cuttings. *M. alba*, *atropurpurea*, *indica*, *nigra*, *rubra* and *tatarica* are all grown in China, but *M. alba* and *M. nigra* are the general favourites and many varieties have been obtained by cultivation,—the shan-sang or hill mulberry, the kin-sang or golden mulberry, the ki-sang or fowl-mulberry, and the i-sang or *Morus tatarica* are all grown. The white species produces little fruit. An epiphyte grows on the mulberry tree in China, it is called sang-shang-ki-sang, and its woody branches are highly prized as a medicine in the pregnant and puerperal states. There is considerable doubt as to the species of *Morus* cultivated in the Punjab plains, but some of *M. alba*, *Cashmeriana*, *indica*, *laevigata*, and *tatarica*, grow in the hills up to Kashmir, 5000 feet, where they abound and to 7000 feet on the Chenab. Vigne states that the mulberry grows in parts

of Tibet, where Thomson mentions it at over 9000 feet. From the accounts by Dr Bellow and others, nine or ten kinds would appear to be abundant in parts of Afghanistan. Some of the trees attain to large size, specimens of 10 and 12 feet girth are not very uncommon, and Dr Stewart noted one of 16 feet in the Salt Range. The wood of old trees is strong and useful and is much employed for construction, implements, &c, in parts where the tree is common. About Peshawar it is the staple ordinary timber. The fresh barks are in Kashmir used for tying loads.

The Japanese make abundance of paper, as well for writing and printing, as for tapestry, handkerchiefs, packing cloth, for goods, &c. It is of different qualities, and some of it is as soft and flexible as our cotton cloth. Indeed, that used for handkerchiefs might be mistaken for cloth, so far as toughness and flexibility are concerned. The materials of which it is made is the bark of *Morus papyrifera*, now transferred to the genus *Broussonetia*. In December, after the tree has shed its leaves, they cut off the branches about three feet in length and tie them up in bundles. They are then boiled in a ley of ashes in a covered kettle, till the bark is so shrunk that half an inch of the wood may be seen projecting at either end of the branch. When they have become cool, the bark is stripped off and soaked in water three or four hours until it becomes soft when the fine black skin is scraped off with a knife. The coarse bark is then separated from the fine, the new branches make the finest paper. The bark is then boiled again in fresh ley, continually stirred with a stick, and fresh water from time to time is added. It is then put in a sieve and taken to a brook, and here the bark is incessantly stirred until it becomes a fine pulp. It is then thrown into water and separates in the form of meal. This is put into a small vessel with a decoction of rice and a species of *Hibiscus*, and stirred until it has attained a tolerable consistence. It is then poured into a large vessel, from whence it is taken out and put in the form of sheets on mats or layers of grass straw, these sheets are laid one upon another with straw between, and pressed to force the water out. After this they are spread upon boards in the sun, dried, cut, and gathered into bundles for sale. This paper will better endure folding, and last longer than that of Europe.—*American Expedition to Japan* p 61 Dr O'Shaughnessy, p 577 Royle *Fib Pl* p 341 William's *Middle Kingdom*, p 28. The Musk deer is found from Siberia, through Central Asia to the Himalaya, in these mountains it is found at great elevations, in summer rarely below 8,000 feet and as high as the limits of the forest. It is solitary, living in retired spots, near rocks, or in the depths of the forest. It is easily traced by the heaps of dung on its runs, for it is partial to localities, and both in habits and general appearance has a great affinity to the hare. Adams sometimes found it by following up its trail through the copse across the grassy glade into a little dell, where the indifferent creature might have been seen feeding within a few yards. The mode of its progression is remarkable and comprises a series of spasmodic leaps while now and then it stops to reconnoitre, or walking a few feet, resumes these fantastic movements. The musk is most sought after during the rutting season in autumn. Adams repeatedly examined the contents of bags at other seasons, but except a rank offensive odour from the dark pigmentary substance contained in them, he could not discover a trace of musk. It is said that unless the musk-bag be removed before the body cools the scent evaporates. The market-value of each bag is from £1 to £1 10s. *Adams Naturalist in India* *Jerdons Mammals*

a chain of islands parallel to the Marlaban coast, from lat 14° 27' N to lat 13° 47' N distant from it 3 to 5 leagues. The islands are steep, having 20 or 22 fathoms close on to the western sides.

MOSCOVIA, Sp Russia leather

MOSCOW, one of the chief towns of Russia in Europe

MOSELINA, Sp Muslim

MOSES, a leader of the Hebrew race, known amongst mahomedans who recognise him as a prophet as Musa, or Hazrat Musa, also as the Kalam-ullah or mouth piece of God and as the author of the five books which they style Taurat. His Egyptian name means Son of the Water, he had been brought up in the neighbourhood of Heliopolis, the chief seat of Egyptian philosophy. On leaving the city of the Sun, called in Coptic Ramesses, in Greek Heliopolis, he marched the first day sixteen miles along the right bank of the Pelusiac branch of the river. He rested the first night at a village called the Tents, in Hebrew Succoth, in Greek Scour. Moses, led the Israelites out of Egypt B C 1320 — *Shaape's History of Egypt*, Vol 1 p 50

MOSES OF CHORENE, wrote a little after A D 410, and probably drew from earlier authors. He speaks of Tensadai (i.e. Christian or China land) as a great plain country east of Scythia, at the extremity of the known world, and occupied by a wealthy and civilized people of character so eminently pacific as to deserve to be called not merely friends of peace but friends of life. Their country then furnished an abundance of silk, inasmuch that silk dresses, so rare and costly in Armenia, were there common to all classes — *Yule Cathay* I p 83

MOSHANI See Kuirumbani

MOSLIM ARABO-EUROPEAN, a term by which mahomedans in Asia designate themselves, it is derived from the Arabic word salam, he gave safety, peace, and hence moslim, a person who is saved, the plural of which is musulmin ordinarily written Muslim and for the female Mussulmani

The first intimation of the Mahomedans attempting the invasion of India is during the kalifat of the Kalif Omar, who built the port of Bassorah at the mouth of the Tigris, chiefly to secure the trade of Guzerat and Sind into which latter country a powerful army penetrated under Abul Aas, who was killed in battle at Aror. The kaliph Oosman, who succeeded Omar, sent to explore the state of India, while he prepared an army to invade it in person, a design which he never fulfilled. The generals of the kaliph Ali made conquests in Sind which they

abandoned at the death of Ali. While Yazid was governor of Khorasan several attempts were made on India, as also during the kalifat of Abdool Malak, but without any lasting results. It was not till the reign of Walid that any successful invasion took place. He not only finally conquered Sind and the adjoining continent of India, but rendered tributary all that part of India on the W side the Ganges. The energy and rapidity of such conquests are manifested by observing the aims of Islam at once on the Ganges and the Ebro, and two regal dynasties simultaneously cut off, that of Roderic, the last of the Goths of Andalus, and Dahir Des-pati in the valley of the Indus. It was in A H 99 (A D 718, S 777) that Mahomed bin Kasim vanquished and slew Dahir prince of Sind after numerous conflicts. Amongst the spoils of victory sent to the Kaliph on this occasion were the daughters of the subjugated monarch, who were sent to the kalif but were the cause of Kasim's destruction, when he was on the eve of carrying the war against rajah Harichand of Kanouj. They asserted that Kasim had seen them before then setting out, on which the kalif ordered Kasim to be cowed up in a raw hide and so forwarded and the girls, seeing their country's victor in that condition, acknowledged that they had unintentionally deceived the kalif. Some authorities state that Kasim actually prosecuted the war and as Sind remained a dependency of the caliphate during several successive reigns, the successor of Kasim may have carried out his plans. Little is said of India from this period to the reign of Al-Mansur, except in regard to the rebellion of Yazid in Khorasan, and the flight of his son to Sind. The eight sovereigns, who rapidly followed, were too much engaged with the Christians of the west and the Huns on the Caspian to think of India. Their armies were then in the heart of France, which was only saved from the Koran by their overthrow at Tours by Charles Martel.—*Toll's Rajasthan Vol 1 p p 212 to 214* *Burton's Pilgrimage to Mecca, Vol 1 p 133*

MOSQUE, the place of public worship amongst mahomedans. The word is doubtless derived from the Arabic Masjid or Masjid. It is generally a square with three walls so built that looking to the back wall the worshipper faces Meccah. The Kazi or preacher stands on a Mimbar, a small dais with three steps built against the back wall. The first mosque of the mahomedans was erected by Mohammed Kuba at El Medinah shortly afterwards, when he entered Meccah as a conqueror, he destroyed the idols of the Arab

pantheon, and purified that venerable building of its abominations. He had probably observed in Syria the two forms appropriated by the christians to their places of worship, the cross and the Basilica, he therefore preferred a square to a parallelogram, some authors say with, others, without, a cloister, for the prayers of the "saving faith." At length in the reign of El Walid (about A H 90) the cupola, the niche, and the minaret made their appearance, and what is called the Saracenic style became the order of the mahomedan world.

MOSQUITO **MACH'R** **HIND** A term applied to certain stinging flies belonging, in all probability, to several distinct genera. The mosquitoes are either gnats or gnat-like insects, which are furnished with a proboscis adapted for piercing the flesh, and at the same time forming a kind of siphon through which the blood flows, this instrument moreover injects into the wound which it makes a poison which causes inflammation. Many insects called mosquitoes probably belong to the same tribe as the common gnat (*Culex*, *Lin.*), Humboldt however asserts that the insects known by that name in America belong to the genus *Simulium*, and that the *Culex*, which are equally numerous and annoying, are called *Zinendoes*, which means long legs. The former are what the French call *moustiques*, and the latter cousins. Of all insect pests the most provoking by far is the mosquito, *Culex fatigans* *Willd* next to the torture which it inflicts, its most annoying peculiarities are the booming hum of its approach, its cunning, its audacity, and the perseverance with which it renews its attacks however frequently repulsed. In Kandy Mr Thwaites finds *C. fusca*, *C. circumvolans*, &c, and one with a most formidable hooked proboscis, to which he has assigned the appropriate name, *C. legius*.

It is not however only in tropical countries, that these insects swarm. The mosquitos and other insects that fill the air during the summer months in high latitudes, are, in fact, the scourge of man as well as of beast. No one, indeed, who has not traversed the swamps and forests of Lapland or America, can form the most distant conception either of their numbers or the annoyance to which they subject the way-farer. A traveller relates that when in Lapland, he suffered exceedingly from the bite of the mosquitos. Until in a state of fever, and that his face was marked as if recently recovered from the small pox, he set those troublesome insects at

defiance, but after a time, following the example of others, he was accustomed to wear a veil—an evil of itself of no inconsiderable magnitude under a burning sun, and when perhaps the thermometer ranges at from 80° to 90° in the shade. Even the hardy Lapps and squatters are obliged to guard the exposed parts of their persons in one way or another. Some smear their faces with tar or the like, whilst others again wear a cowl, like a monk, which, leaving little more than the eyes, nose, and mouth uncovered, falls down over the shoulders, and thus completely protects the more vulnerable parts, such as the forehead, the ears, and the neck, from the attack of the venomous insects. When on a journey, moreover, these men are never without a sort of linen sheet, which they throw over their persons when resting, or at the bivouac. This sheet is a very needful part of one's travelling equipments. When his comrades have been reposing beneath its friendly shelter, he had seen it so completely covered with mosquitos, that the sheet itself was hardly perceptible, all that met the eye, in short, was a living dark mass. Even within doors, the Lapland traveller is sadly pestered by these insects, for though peat, placed in an open iron pan, is kept constantly burning at the outer doorway, and the apartment not unfrequently filled with smoke arising from green boughs, which for that purpose are cast on the fire, yet those troublesome guests find their way into the room in numbers, so that what with their stings and constant buzzing, a man, unless nature be quite exhausted, has little chance of obtaining any repose. The bite of the mosquito gives rise at times to somewhat ludicrous scenes. On one occasion, for instance, when descending a feeder of the great river Muonio, in Tornio Lapmark, where he had been fishing, the man who was rowing was so pestered by these insects, as to be almost beside himself. For a while he resorted to various expedients to rid himself of the enemy, but his patience becoming at length fairly exhausted, he suddenly dropped the oars, and throwing himself over the side of the boat, clothed as he was, plunged head-long into the water. This device, which afforded much amusement, if it did not altogether relieve the poor fellow from his tormentors, tended at least to cool his blood, and to give him a temporary respite from pain.

But though the Scandinavian mosquito is a sore pest to man as well as beast, it would seem from the accounts of travellers, that his compeer in the American wilds is a still greater scourge. Captain Franklin,

when speaking of this insect, very eloquently says,—‘The food of the mosquito is blood, which it can extract by penetrating the hide of a buffalo (American Bison), and if it be not disturbed it gorges itself so as to swell its body into a transparent globe. The wound does not swell like that of the African mosquito, but it is infinitely more painful, and when multiplied a hundred fold and continued for so many successive days, it becomes an evil of such magnitude, that cold, famine, and every other concomitant of an inhospitable climate must yield the pre-eminence to it. It chases the buffalo to the plain, irritating him to madness, and the Rein-Deer to the sea-shore, from which they do not return until the scourge has ceased. Mr T. W. Atkinson, in his recent narrative of *Adventures in Oriental and Western Siberia, Mongolia, &c.*, had also reason to complain bitterly of the scourge of mosquitos over much of the country which he traversed. The mosquito has three stages of existence, in two of which it is a water insect, in the third the well known winged one. On the 6th May, at 6 A.M. Dr Gilchrist observed several mosquitos on the surface of some stagnant water, each in close proximity to a yellowish substance, which, when viewed through a microscope, proved to be a collection of eggs, that the mosquitos were depositing, each collection, though consisting of not fewer than one hundred eggs, did not exceed three-twentieths of an inch in length and about one-twentieth of an inch in breadth. These eggs were arranged in lines, standing on end, and were each about 1-10th of an inch long, the lower end being larger than the upper, so that the upper surface of the collection was somewhat concave. A few of these collections of ova were carefully introduced, with some of the water on which they floated, into a tumbler, and placed under a glass shade. Excepting a change of colour, from a yellow to a dark brownish grey, which occurred within six hours after being put into the tumbler, no visible alteration took place, till two days and a half, when the water was found to swarm with animalculæ. The shells of the ova were still adherent, as when first observed. On examining one minutely, the larger, or under, end was found to have opened, like a lid, to allow the insect to escape into the water. A lady's thimble, furnished with a lid, would resemble exactly the appearance of what is being described. The design of having the lids placed at the bottom, is, evidently, to allow the newly hatched animalculæ immediate exit from the shell into the water,

and the concavity of the whole collection above alluded to, effectually tends to retain the large ends undermost. Had the ora been winged promiscuously, as to the large and small ends being upwards and downwards, it is evident that the newly hatched insects, under the former arrangement, would have some difficulty in reaching the water, a difficulty that most probably, would amount to an impossibility, one which, at all events, is effectually prevented by the concave form of the collection. In the newly hatched insect, the chest, or thorax (the heart is seen obscurely however, the body being only semi-transparent), furnished with four projections, from this origin two blood vessels proceed down the centre of the body, to the end of the elongation the extreme termination of which is to be seen just above the surface of the water, where the insect lives, for the most part, the body being suspended as it were, from the head lowermost. Between the heart, in the thorax and the extremity of this irregular elongation, an active sanguiferous circulation is to be observed, in all probability, therefore, it is the seat of the lungs or gills, and it would appear, that a comparatively large supply of air, is essential to the existence of the insect, as it lives as much as possible in this pendulous position at the surface with the extremity of the elongation rising just above. Its motion, which is quick, is effected by a rapid bending of its whole body, so that the head and tail (the latter consisting of a bundle of delicate filament-) approximate, alternately, on either side of the body, it always goes tail foremost, so that the head is dragged along behind. When in search of food, it throws out, in advance of its mouth, a couple of delicate brushes, the individual filaments of which, are of microscopic size. Each of these is put in rapid circular motion whereby a double kind of whirlpool is occasioned, whatever food comes within the sphere of these vortices, is speedily devoured. The food appears to be, principally, decomposing vegetable matter, some of which he put into the tumbler, as the vessel in which the ora were discovered contained it, on this they fed voraciously. They did not however entirely confine themselves to a vegetable diet. He was much amused with one, when in a drop of water under the microscope, in these confined limits its appetite did not forsake it, and the only article of food it found, was the head of one of its own species. So soon as this came within the vortex, it was ravenously seized, but, being apparently, too large a morsel, it was

let go, after sundry futile attempts at swallowing. It frequently came within the whirlpool again, and was as often seized, but with no better success. They, however, eat the shells they had recently quitted. Some that were kept in clean water, without food, died on the third day. In this stage of their existence, the insects were lively and grew uprice. At the termination of 21 days, during which the water was thrice changed, they had attained three or four twentieths of an inch in length. On attaining this size or age, they underwent a second metamorphosis. Most likely they cast their former envelope, for the hairs, so conspicuous on the former insect, were not to be seen on the present. The shape, it will be remarked, has materially altered, but the most remarkable change is that which occurs with respect to the seat of the lungs, or gills. These organs are now situate in the thorax, their former seat has disappeared, and the channel of communication, now, between them and the air, are two small tubes on the top of the chest. In this stage of their existence, the insects are much less active than during the former one. A still greater contrast, however, is that, now, they do not require food, and have no mouth, in this respect resembling the chrysalis stage of the butterfly tribe. But the demand for air appears increased, they rarely leave the surface of the water, and when they do descend, they take down a supply of air, small globules of which are distinctly to be observed, at the end of the tube. Then descent is accomplished by striking the water with their body, but, being specifically lighter than that fluid, they rise without any effort to the surface, though, in case of despatch, can impel themselves upwards by the same means as they descended. However, as has been remarked, they seldom leave the surface, and, having done so, speedily return to it. The insects remain about 48 hours in this stage, towards the termination of which the legs and proboscis of the winged mosquito can be distinctly seen through the thin membrane that surrounds it. This in due course, bursts, when the winged mosquito draws itself out, stands on the surface of the water a few minutes, to dry and expand its wings, on which it presently proceeds to a dry situation. If the mosquito, when in either of the first two stages be taken out of the water, it speedily dies, and it is as speedily deprived of life, if immersed in that fluid immediately after becoming the winged insect. We learn, from the above, that the mosquito is a most prolific insect and that, as stagnant water, such as that of tanks, &c, is necessary to its pro-

MOTACILLIDÆ

when it was the thoroughfare for the caravans, between Europe and India. It formerly enjoyed a high reputation for the manufacture which derives its name from the town and is known in France as moussilme and in English as muslin. At a short distance is the mound and village of Nebbi Yunns, in which is a mosque which covers the supposed tomb of the prophet Jonah—*Euphrates and Tigris*, Col Chesney, p 21. See Kndistan, Tigris.

MOSUMOOSAKDI KEERAY, TAM. *Byonia scabra*.

MOTA, a large town in Godjam in Abyssinia, said by Di Beke to contain 3,000 inhabitants.

MOTACILLA, a genus of birds of the family Motacillidæ. In S India the pretty, little, clean-looking, sprightly water wagtail is usually the first and most welcome harbinger of the coming cold weather, and remaining in India abundantly whilst the cold season lasts, this and our little piebald friend the water wagtail, in its season, and the common sparrow, at all seasons, but so abundant as to be overlooked and forgotten, are probably all that the European reader, unversed in the study of ornithology, will be able to recall to mind, as yielding associations of home, the pied wagtails of India '*Motacilla luzonensis* and '*M. dukhunensis*' are specifically different from those of Europe. *M. alba* and '*M. yamella*', however similar in appearance and habits, but the grey wagtail of Britain '*Calobates sulphurea*' is identically the same in India and Java, and a specimen has been seen in a collection from Australia. This delicate little bird, so clean and bright in its appearance, is of very general diffusion over Southern Asia during the cold season, being indeed much commoner than in Britain, an individual of the *Motacilla boarula* is occasionally to be seen. The pied wagtail, *Motacilla dukhunensis* is very plentiful, it is one of the wagtails of India and with the *Motacilla luzonensis*, another of the pied wagtails of India, is specifically different from those of Europe. Perhaps, if more was known of the general distribution of this species and the pied wagtail of Western India '*M. dukhunensis*,' also the well known European bird, the slight differences in plumage would scarcely permit us to separate them. The great pied wagtail the '*Motacilla maderaspatana*', is rare.

The yellow-wagtail lark is the *Budytes viridis*, the feathers on its head are blue-gray in spring and summer, *Col Rev Blyth Adams*. See Birds.

The eastern nations deem the term mother, to be one of the most reverential that can be used, towards a woman and the expressions, big mother, little mother, are acceptable to all, aged women or spinners. Genesis xiv relates how they blessed Rebekah, and said unto her, Thou art our sister, be thou the mother of thousands of millions, &c. Similar addresses to a daughter when she is going from her father's house to live with her husband are very common among the hindoos, such as, 'Be thou the mother of a son' 'Be thou the wife of a king', &c. I remember says Colonel Tod, in my subaltern days, and wanderings through countries then little known, one of my Rajpoot soldiers at the well, impatient for water, asked a woman for the rope and bucket by the unenvied term of rand, meaning widow, "Myn Rajputni che," I am a Rajputni," she replied in the Hara dialect, to which tribe she belonged, "am Rajpoot camacho," 'and the mother of Rajpoots' At the indignant reply the hands of the brave Kulhan were folded, and he asked her forgiveness by the endearing and respectful epithet of "mother." It was soon granted, and filling his brass vessel, she dismissed him with the epithet of "son," and a gentle reproof. Kulhan was himself a Rajpoot, and a bold one lived not, this was in 1807 and in 1817 he gained his sergeant's knot, as one of the thirty-two firelocks of Col Tod's guard, who led the attack, and defeated a camp of fifteen hundred Pindaries.

There are few of the lowest Rajpoot chieftains, whose daughters are not instructed both to read and write, though the customs of the country requiring much form in epistolary writing, only the signature is made to letters. But their intellect, and knowledge of mankind will be acknowledged by

whoever has had to converse with a Rajpoot—guardian of her son's rights Though excluded by the Sahclaw of India from governing, they are declared to be fit regents during minority, and the history of India is filled with anecdotes of able and valiant women in this capacity—*Tod's Rajasthan, Vol I* pp 641, 642

MOTHER-O'-PEARL

Nacre, ENG | Indung mutigara, MALAY
Chip, GUJ HIND PERS | Sipi, HIND

Mother-of-pearl, or Nacre, is the hard, silvery, internal layer of several kinds of shells, especially oysters, the large varieties of which in the Indian seas secrete this coat of sufficient thickness to render the shell an object of commerce The Conchiferous, shell-fish, furnishes the finest pearls as well as mother-of-pearl it is found round the coasts of Ceylon, near Oimus in the Persian Gulf, at Cape Comorin, and in some of the Archipelagic and Australian seas The dealers in pearl-shells consider the Chinese from Manilla to be the best they are fine, large, and very brilliant, with yellow edges Fine large shells of a dead white are supplied by Singapore Common varieties come from Bombay and Valparaiso, from the latter place with jet black edges South Sea pearl-shells are common with white edges The beautiful dark green pearl-shells, called ear-shells or sea-ears, are more concave than the others, and have small holes round the margin, they are the coverings of the Halotis, which occurs in the Californian, South African, and East Indian Seas In the Indian collection of the Great Exhibition, specimens of the finest mother-o'-pearl-shells were shown, such as the *Meleagrina margaritifera*, *Halotis gigas*, *Halotis iris*, and a large species of *Turbo*, which shells are known in commerce as flat-shells, ear-shells, green snail-shells, buffalo-shells, Bombay shells also furnish mother-o'-pearl Mr Banks states that the shores of the Sooloo Islands afford the finest shells The beautiful tints of mother-of-pearl

depend upon its structure, the surface being covered with a multitude of minute grooves which decompose the reflected light It is in consequence of this lamellar structure that mother-o'-pearl-shells admit of being split into laminae for the handles of knives, for counters, and for inlaying Splitting, however, is liable to spoil the shell, and it is therefore avoided as much as possible The different parts of the shell are selected as nearly as possible to suit the required purposes, and the excess of thickness is got rid of at the grindstone Mother-o'-Pearl shell is obtained on the Australian Bank The Mother-o'-Pearl shells of the Ann Islands and Sulu, sell at £3 2-6 per 133½ lbs avoirdupois The Mother-of-Pearl from the Red Sea is taken to Jerusalem, and there made into chaplets, saints' figures, and crucifixes for christian pilgrims At Meccah it is worked into rosaries for the Haji or pilgrims In Europe and China it is made into buttons, in ornamentation of the papier mache work, cabinet and ornamental work, which cause a considerable demand for it Some good pearls are procurable in the Red Sea Mother-o'-Pearl shells and tortoise-shell are brought to China from the Archipelago and the Islands of the Pacific, but a large part is re-exported in the shape of buttons, combs, and other productions of Chinese skill The shells of the pearl oyster are of almost as much value as the pearls, the nacre of these shells being extensively employed in manufactures for useful and ornamental purposes Other shells however have a large nacreous surface one kind called silver lipped is imported to Liverpool, another kind called black lipped is brought from Manilla and a smaller shell from Panama Coral and Mother-o'-Pearl, although seen in India, these and all the inferior gems are held in but little esteem by the people who value a gem for its intrinsic price not for the workman's skill expended in shaping it, in which the chief value of all the inferior gems consists—*Ousley's Travels, Vol 1, p 211 Chambers Ed Town, June 1868 Tomlinson Cat Ex 1862 Burton's Pilgrimage to Meccah, Vol I, p 265. In Southern India, the highest peak, Doda-
betta (8,160 feet), is situated in the Nilgiris

Of the peaks in the central parts of Cey-
lon, the Pedu u talla Galle reaches about the
same height, rising up to 8,305 feet, the
well-known Samanala, or Supada (Adam's
Peak), attaining 7,385 feet

In the mountain chains of Central India,
in the Vindhya and Arwally ranges, the
peaks are considerably lower, Abu being
3,850 feet, and Rajmugrah, 3,753 feet

The Kalsubai, the highest peak of the
Dekhan, attains only 5,400 feet

In the Himalaya, Gaurisankar or Mount
Everest (29,002 feet), is the highest peak in
the world yet discovered, it is 6,000 feet
higher than the dominating peak of the
Andes, and 13,220 feet above the most ele-
vated parts of the Alps

The highest peaks of the Karakorum are
the Dapsang (28,278 feet), the Damer
(26,629 feet), and Masheribum (25,626
feet).

Table of the principal peaks,

Diamer	26,629		

D — In the Kuenluen,

the peaks seem not to exceed 22,000 feet. In the Himalaya, the lowest height at which snow has fallen in winter is about 2,500 feet, but such cases are extremely rare, having occurred in Kamaon and Garhwal only twice (in 1817 and 1847), since the British took possession of the country. At an elevation of 5,000 feet scarcely one year in ten passes by without snow-fall, but at this height the snow disappears after a few days, and sometimes even hours. "It snows, but one does not see it," said the natives of Kathmandu (4,354 feet) meaning, that the rare nightly snow-falls are melted away by the earliest rays of the sun. 6,000 feet may be assigned as the limit where snow regularly falls in winter with a probability of remaining some time upon the ground.

In Western Tibet and in the Korakorum the general elevation of the country is so great even in its lowest regions, that no part lies below the limit of hibernal snow-fall.

In the Kuenluen, even on its southern slope a greater amount of snow is precipitated than on the northern side of the Karakorum, while its Turkistan (northern) slopes differ still more from the Korakorum in this respect.

The values obtained for the height of the snow line on the three mountain chains of High Asia are

a — Himalaya	Feet	16,200
Southern (Indian) slopes		17,400
Northern (Tibetan) slopes		
b — Karakorum		19,400
Southern (Tibetan) slopes		18,600
Northern (along the Turkistan plateau)		
c — Kuenluen		
Southern (facing mountainous ramifications)	15,800	
Northern (facing the Turkistan plain)	15,100	

The following mountains and points in the environs of Massuri were determined by the Great Trigonometrical Survey of India, under General Sir Andrew Waugh.

Central Asia is a term used differently by geographers, ethnologists, and politicians, but is usually applied to the region intervening between Russia in Asia, and British India, and lying to the west of Chinese Tartary. Its western boundary is the Caspian Sea and the river Ural. On the east, is the lofty table-land of the Bolor (the mountains which form the western boundary of Chinese Turkestan and Dzungaria), and the river Irtysh, and the northern boundary is western Siberia, and it has Afghanistan on the south east, on the eastern side of Central Asia, is a fertile tract, watered by the great rivers the Jaxartes and the Oxus. The whole country of Central Asia between India

MOUNTAINS

and Tartary is one broad mountain range, the Himalaya forming the southern crest, and the Kuen-luen the northern. The interior has some lovely valleys like Kashmir, but it is more usually broken into rocky ravines, through which the affluents of the Indus force their way towards the plains, or else stretches away in those vast treeless uplands, which are one of the chief characteristics of the range through its whole extent. The ascent from Yarkand and Kashgar, westward to the table-land of Pamir, is almost imperceptible and when that lofty position is gained, where the average elevation is probably as much as 15,000 feet above the sea, a vast open plain is seen, which stretches from the valley of the Jaxartes in one direction, across the head streams of the Oxus, to the top of the Kashgar or Chitral Valley in another. This plateau may be 700 or 800 miles in extent. It is studded throughout with lakes, and from it descend four great river systems. The Naïm, which is the main stream of the Jaxartes, runs through a long, luxuriant valley, between the culminating ridge and outer range of the Tian Shan, and drains all the northern range of the plateau. The Oxus, rising in the Sami Kul or Yellow lake of Pamir, at least 300 miles to the south of the Jaxartes, receives from its right bank a multitude of small streams, which run to the south through rugged valleys, on the south-western face of the Pamir uplands. The western face of Pamir between the Jaxartes and the Oxus, is far more precipitous than the eastern. Ridges run out as far as Samuind and Kashi and the streams from the upland which twine amongst these ridges form the Zairishin and Kashi part of the water system of the Oxus, though before they reach that river they are entirely consumed in irrigation.

The *Kuen-luen*, mountain chain, as seen from Sumgal in Turkestan is in lat 36° 8' N, and long, 78° 5' E, and 13,215 feet above the sea. The Kuen-luen is the northern crest of the great range which bounds the high table-land of Tibet. This range is the true watershed between India and Central Asia, the Indus absorbing all the streams which flow from the southern slopes of the range, while the northern rivers which form the Kara Kush force their way through or round the outer barrier of the Kuen-luen, and wend northward to the Gobi or Sandy desert. In the Kuen-luen, all passes above 15,000 feet, are closed in winter by the heavy snow-fall. The following are the principal passes in India and the world,

(a) These two passes cannot be used for practical purposes

It has often been observed that the Koh-i-Kush offers a plausible etymology for the Caucasus of the classical writers. It is supposed by Ritter and Wilford to be the mount mentioned by Pliny under the name of Graucasas, but slightly deviating from the Sanscrit Gravakasas meaning shining rock. The only known route across the Hindoo Koosh range, fit for artillery or wheel carriages, is the Bamian pass.

The heights of the following localities have been ascertained as under

MOUNTAINS

The *Thian-shan* mountain chain has three characteristic divisions, from the meridian of Kucha 82° 48' E, to its intersection with the Bolor. To the East, from the transverse course of the Aksu to Kucha, the celestial mountains rise in a towering ridge, covered with perpetual snows, which feed enormous glaciers, and are therefore called the Muzart or Icy mountains. There is only one pass through the Muzart mountains, which is called by the Chinese "the pass of Glaciers" and by Humboldt "Djepaile." Through this pass there is a road leading from Kuldja, 45° 54' N', 80° 58' E to Aksu.

The *Bolor* mountains, otherwise called *Alai* by the Andjans, are precipitous and inaccessible on their western face, and form on the east a high, cold plateau, visited only in the summer by the Kughiz. There is only one caravan road over the Bolor, which passes through Badikshan. This Badakshan road is said to be very fatiguing, and, at best is not practicable on horseback. The road through Badakshan to Yarkand leads to Khulum, thence to Bokhara, Balkh, and Cabul, caravans requiring sixty-five days to reach Bokhara by this route.

The *Pamir* is intersected by roads well-trodden by the Kughiz, all of which lead to the khanate of Kokan, or to Karategin.

Over the *Kuen-Lun* one pass is known, that of Kara-Korum, by which Eastern Turkestan communicates with Tibet and India.

Eastern Turkestan is enclosed by mountains on three sides by the *Thian-shan* on the Northern, the *Bolor* on the Western and *Kuen Lun* on the Southern. These mountains belong to the highest ranges of Central Asia, and form the natural limits of the western portion of the Chinese Empire. The actual boundary, however, runs along the line of pickets stretching through the outlying lower ranges on the Chinese side, beyond this frontier the territory is occupied by roaming Kughiz, who recognize the authority of the Kokhan khan. To the eastward, Eastern Turkestan is bounded by the uninhabited sandy deserts of the Makhar and Kunul Gobi. It occupies consequently a plain between 36° and 43° North latitude, and 70° and 90° East longitude, from the meridian of Paris. Eastern Turkestan occupies the centre of the table-land of Eastern Asia, but Humboldt, guided by the vegetable productions of these parts, concludes that the plain of Little Bokhara cannot have an absolute elevation of more than 1,200 feet, and calls it the Taim depression after the river Taim-gol (otherwise Elgol), whose basin occupies the whole plain of Eastern Turkestan. Little

Bokhara does, in fact, present the appearance of a great depressed valley, resembling, in physical features, an open plain, and this general view receives confirmation from a consideration of the course of the river Egiol, whose bed slopes very gradually to the eastwards. The interior of this country is a sandy desert, the peculiar features of which first become visible in the eastern slopes of an undulating range of hills, of no great width, between Yanyshah and Yarkand. From this region it gradually widens as it runs to the eastward, where it forms the vast Gobi, devoid of all vegetation, though interspersed with reservoirs of blackish water, and where the sand is heaped in such lofty ridges that the inhabitants give them the name of "Gag" (mountain). If we are to credit native writers, this sand is subject to the same phenomena of drifting and regular locomotion as the famed moving desert of Africa, and occasionally buries whole cities. The parts that lie at the foot of the mountains have a clayey soil, strewed with small stones, and in some places impregnated with salt. The numerous rivers running from the neighbouring hills afford means for the artificial irrigation of the earth, which would otherwise yield but scanty and poor vegetation, owing to the extreme dryness of the air, and, at best, there are but a few well-watered parts that form fertile oases. These cultivated and peopled patches form a ring round the base of the Thianshan, Bolor, and Kuen-lun. The water system of the river Tarym, with its tributaries, relieves the interior of this desert, by a narrow strip of fertile land along the various river courses, where the fertility of the soil admits of a rude system of cultivation.

Jullundhar The higher portion of the Jullundhar is a tract abounding in mineral wells of all descriptions, where the icy stream of the Parbutti, close to the boiling fountain of Munneekain, which rises in a jet at an elevation of 5,587 feet could furnish Russian baths, if they were desired, and where the immediate vicinity of a chalybeate is not to be forgotten where some are reported to contain Iodine or Bromine (the asserted presence of less than $\frac{1}{2}$ of a grain of bromide of potass, with the moiest trace of iodine, in 16 ounces of the water, was the making of the saline of Kreutznach), and where some must possess the advantage of an almost European climate. In this district also and on the banks of the Beas, is Bishit, at an elevation of 6,681 feet, with an ample thermal sulphuretted source.

Beluchistan The mountainous table-land of Beluchistan extends from Cape Monze, in the south to the Afghan mountains north of Quetta, or from 25° to $30^{\circ} 10'$ N latitude, and is consequently about 340 miles in length. The great central mountain range or table land, running north and south, comprises the provinces of Sistan, Jhalawan, and Lar. The Braham appear to have been a nation of Tartar mountaineers, who settled, at a very early period in the southern parts of Asia, where they lived an ambulatory life in khels, or societies, headed and governed by their own chiefs and laws, for many centuries, and at length they became incorporated, and obtained their present footing at Kelat and throughout Beluchistan. It is impossible to form more than a supposition what was the nature of the region from which they emigrated, but their pursuits and way of domestic life afford the strongest reason for believing that they were originally mountaineers, and some amongst them claim that the very name demonstrates this, by its signification being a compound of an alpe (hill) and rohi, a word said to mean a hill in the dialect still spoken in some parts of Tibet, such reasoning, however, is not entitled to any great dependence, though supported by the collateral evidence of the Beluchians, being called in one quarter of the country Shivan, which, if we admit the former derivation, means "lowlanders," i.e. literally not hill-men, a name they receive from the Braham when they came amongst them, and evinced a preference for the more fertile districts, low villages, and plains. The Braham imagine themselves the aborigines of the country.

Continental India, its primary divisions are four—Hindustan, in the widest sense of that term, including the whole Western Peninsula and the Gangetic plain to the base of the Himalaya. 2 The Himalaya, a mountain chain which rises abruptly from the Gangetic plain, and is connected with a still loftier mountain mass (of Tibet) to the north, and beyond India. 3 Eastern India, India ultra Ganges, including the kingdom of Ava and the Eastern or Mahayan Peninsula. 4 Afghanistan. These divisions are marked out by great mountain barriers and by the ocean. The Himalaya mountains on the north are nowhere under 15,000 feet, usually exceeding 17,000 and 18,000 feet and rise in isolated peaks or groups of peaks from 21,000 to 28,000 feet. The name in Sanscrit, signifies the abode of snow, or home of snow and is sometimes written "Himmalah" conformably

MOUNTAINS

to the pronunciation. To the Greeks and Romans, part of the Himalaya was known as the *Imrus*, and Pliny, (*Hist Nat VI 17*) was aware of the significance of the name for he says *Imrus*, *incolarum lingua inuicem significans*.

The direction of the Himalaya range is not parallel to the equator, the western extremity being the most northern. Its height is nowhere below 15,000 feet, usually exceeding 17,000—18,000, and rising in isolated peaks, or groups of peaks, to from 20,000 to 28,000. The mountain mass of Asia sinks to the westward of Afghanistan, rising again only in isolated peaks, and hence the Himalaya is rather ideally than really connected with the mountains south of the Caspian, and so with the Cevenin Alps on the one hand, and those of Asia Minor on the other. The Afghan mountains form a meridional chain from the western extremity of the Himalaya, descending parallel to the Indus, with a gradually decreasing elevation, from above 15,000 feet, to the level of the sea, at the Arabian Gulf. The Arava and Malayan mountains form a chain parallel to these which is given off from the snow-clad mountains of East Tibet, and though rapidly diminishing in elevation, is continued uninterruptedly almost to the Equator. In the Peninsula of British India the Western Ghats extend from Cape Comorin to the Tapti river. The Vindhya chain crosses the centre of Hindostan from the Gulf of Cambay to the Ganges. The Arava mountains, extending from Hansi and Delhi to Gujerat. The Peninsular chain forms a continuous watershed, throughout its length of upwards of nine hundred miles, scarcely deviating from a straight line, which is parallel and close to the west coast of the Peninsula, and perpendicular to the direction of the monsoons. This chain divides the Peninsula of India unequally into two portions, marked by different climates, a narrow western one, including the provinces of Malabar and the Concan, and a broad eastern one traversed consequently by all the great rivers, and including the Carnatic, Mysore, and the Dekkan.

The Vindhya chain, consists of two parallel ranges, connected towards their centres, where the table-land of Umakantak is said to attain an elevation of 4,500 feet, elsewhere they are separated by the great rivers Son and Narbada, which rise together and flow in opposite directions. The more southern of these ranges is probably always the higher of the two, but it appears seldom to exceed 3000 feet. The Vindhya moun-

MOUNTAINS

tains were known to the Greeks as the Vindhian. They separate the Ganges and its tributaries from the Mahanuddy, etc which flow south-east to the Bay of Bengal, as also from the Tapti and Narbada, which flow west to the Arabian Sea.

The Siwalik is a sub Himalayan range of the later or tertiary formation. What is strictly called the Siwahk, extends in a north western direction from the right bank of the Ganges, and runs parallel to the Himalayan range, forming the boundary of the Doab between the Ganges and Jumna, beyond this, it skirts the Ambala and Ludhiana districts, and comes to its termination in the Hoshiarpur district. Though this portion alone receives the name of Siwalik, Dr Royle observes that hills of a precisely similar nature can be traced all along below the Himalaya from the Sutlej, as far as the foot of the Sikkim hills and it is not difficult to conceive a continuation of them more or less unbroken, and of greater or less elevation, along the whole southern frontier of the Himalayan system, a distance of nearly 800 miles. At Hardwar, the Siwalik hills form the gorge at which the Ganges issues into the plains of Hindustan. The breadth of this range is at its widest part about ten miles when it approaches the Sutlej river, and towards its termination beyond that river, the range assumes the form of little more than sandhills. The highest part of the range is about Hardwar, and to the south of Garhwal, beyond Simur some of the peaks are as high as 3,000 or 3,500 feet above the sea level. The range is of tertiary formation all alluvial, and in many places consisting of beds of gravel and rolled stones, fragments of the older formations of the Himalayan range above, consisting of granites, limestone, clay-slate, gneiss, mica-schists, &c. Besides these there are beds of loose grained sandstone, with much mica interposing, there are also beds of calcareous conglomerate and subordinate beds of clay. The clay and sand beds of these ranges are fossiliferous shells of the tertiary miocene period abound, but the chief characteristic fossils are the remains of gigantic mammals, among which may be mentioned the Sivatherium, a huge creature somewhat similar to the "tapu" of modern days. The name Siwalik is derived from the hindu divinity Siva. Dr Falconer, on his first visit to the Siwalik hills, inferred that they were of a tertiary age, and analogous to the Molasse of Switzerland. Thirty years of subsequent research by other geologists has not altered that determination, although our exact knowledge of the formation has

been greatly extended. The researches thus begun were followed about the end of 1831, by the discovery by Lieutenants Baker and DuRand, of the great fossiliferous deposit of the Siwalik, near the valley of Markanda, westward of the Jumna, and below Nahan.

North West Himalaya Between the river Indus and the plains of North West India is interposed a mountain tract which has a breadth of about 150 miles in linear distance. One chain forms the line of separation between the waters of the Indus and those of the Chenab and Jelum. To the eastward of the Baralacha Pass it ramifies to a considerable extent its different branches, including between them several depressions quite unconnected with the general drainage of the country, and surrounded on all sides by ranges of hills which prevent any exit of their waters. The principal of these depressions is that of the slightly saline lake Chumorei, another is occupied by the little salt lake first visited by Tiebeck, and called by him Thogu.

All these depressions, though at present unconnected with any of the river systems, have evidently at some former period been so. Chumorei, according to Major Cunningham, is even now very slightly saline, though scarcely perceptibly so to the taste. It has evidently had an outlet at its southern extremity, where it is only separated from the valley of the Parang river by a very low range of hills, which was crossed in 1846 by Mr Agnew, and since then by Captain H. Stachey. The outlet of the little salt lake of Thogu has evidently been near its north end, and its waters, previous to the change in the state of the country which interrupted their exit, in all probability flowed into that tributary of the Zaskar river which runs to the eastward of the Lachalang pass, and which is marked in the map accompanying Moorcroft's Travels as the Sumghuel. The mountain chain which lies to the south of the river Sutlej may also be considered to have its origin in the lofty country adjoining the lakes, but a little to the south and east of them. This chain, which separates the valley of the Sutlej from that of the Gauges and its tributaries (including the Jumna), sinks at last into the plains of India a little to the south of the town of Nahan. The course of this chain has been admirably described by Capt Herbert in his Geological Report of the Himalaya, a paper which contains exceedingly accurate general views of the mountains between the Sutlej and Jumna. Captain Herbert, travelled a great deal in the Himalaya, and was the first to point out the impropriety of regarding these

mountains as a single chain parallel to the plains of India. Jaquemont also arrived at the same conclusion, as will be seen from the following extract from his journal — 'Lo langage de la geographie descriptive est theorique, c'est une grande faute si les theories qu'il rappelle sans cesse sont donnees de fondement. Ainsi l'on dit que le Setludje coupe la chaine centrale de l'Himalaya, que sa vallee est creusee au travers, etc etc, et l'on donne a penser par la que cette chaine auparavant et ut continue et que c'est par un effort des eaux que s'y est faite cette large trouee, comme si les montagnes avaient du se former primitivement avec une continuite non interrompue (vol. II p 201), and again (at p 269.) Le Setludje coule donc non au nord de l'Himalaya, mais entre deux chaines a peu pres egalemeut elevees.' Captain Herbert calls the chain south of the Sutlej the Indo-Gangetic chain, a very inappropriate name, for which, however, it is difficult to substitute a better. Perhaps the name of Cis-Sutlej Himalaya, though not exactly classical, is the best that can be devised, and it so, the chain which, commencing in Kailas, separates the waters of the Sutlej from those of the Indus, may not improperly be designated the Trans-Sutlej Himalaya. Captain R. Stachey, in this paper, on the snow level, proposes to call the more western part of the Cis-Sutlej Himalaya the Buschu range, a name which, though exceedingly appropriate to the portion to which he applies it, is not adapted for extension to the more eastern part.

Kouenlun The northern boundary of Tibet is formed by the great chain north of the Indus, to which Humboldt, following Chinese geographers, has given the name of Kouenlun. Our knowledge of the appearance and course of this chain of mountains, by which Tibet is separated from Yarkand and Khoten, is so extremely limited that, except as to its general direction very little can be said regarding it. There do not seem to be more than four places in which passes exist across the Kouenlun.

The most westerly of these, called in Balti the pass of the Muztagh, lies at the source of the right branch of the Shigar river, a stream which joins the Indus opposite the town of Iskardo. The road over this pass to Yarkand was formerly frequented by merchants, but has, for many years, been disused, the reason assigned being the danger of plunder by the hordes of robbers beyond. As described by persons who had crossed it, the snow is reached after ten days' journey from Iskardo, and continues during three marches. It is said to be quite im-

The eastern portion of the central range has another range parallel to it on the south, enclosing the Chandra Baga or Chinab, and forming the valley of that river which runs among them. First, then, there is the Cis-Sutlej Himalaya, which runs downward towards the plains separating the Ganges basin from the valley of the Beas, including the Suket and Mandi territory. Beyond this, comes the Dhauladhar range (in which are Dhamsala and other well known places), separating the valley of the Beas from Chamba and the valley of the Ravi, and then a system, rather than a definite chain, of hills separating the Ravi from the Chinab.

Beyond the Chinab river and to the south of the great Kashmir valley, are a varied series of hills running off from the Panjal mountains, and forming the elevated country between the Chinab and Jhilm, including Rajauri. Beyond the Jhilm we have a continuation southward of that long mountain series which forms the Himalayan wall of the Kaghan valley. On this is situated the well known hill station of Muzee, this range may be taken as almost the limit of the Himalaya. Beyond this we have the whole hill country of Hazara up to the Indus. Besides these ranges, there are endless subordinate divisions, some of which are so important as almost to obliterate (so to speak) the demarcation above adopted. The rocks which form the principal portions of the higher range of the west Himalaya, consist of granite and syenite, and below that of talcose and chloritic schists and slates, and other metamorphic rocks, interspersed with dykes and interruptions of trap, amygdaloid, and various volcanic rocks, pebbles of which are found in the hill streams and in the beds of conglomerate in the lower ranges. Below these come tertiary formations of various sandstones and clays, as well as of conglomerates formed of fragments of the metamorphic, volcanic and primary rocks of the higher ranges. These huge beds contain boulders often of immense size, which must have been transported by glacial agency, the conglomerate often forms whole cliffs cut into fantastic shapes by water action. The secondary, oolitic, and carboniferous formations are mostly within the Tibetan mountains of the Kuenlun, in British territory they are solely represented from the little province of Spiti, which forms the most north-eastern of British Himalayan possessions. These classes of rocks have been as yet but little studied in the Himalaya. The whole of the Sub-Himalaya ranges, through Rajauri, Jammu, below Chamba,

Kangra and Simla, are entirely occupied by tertiary formations of sand, clay and conglomerate, and below these again, or, more properly speaking, intermingled with them are hills of fossiliferous tertiary formations. The mountain limestone is the most abundant formation in Spiti, and abounds with species of *Ammonites*, *Orthoceras*, *Spurifer*, *Terebratulina*.

The *Bara Lacha* and many other mountains, from 16,000 to 20,000 feet high, are secondary, though certainly very uncommon heights for secondary mountains. The Khattak range continues the boundary to the Indus, maintaining an average height of from 3,000 to 5,000 feet. The Salt Range is a very well defined group of hills in its western and southern portions. Its elevation is inconsiderable, varying from 2,000 to 5,000 feet at extreme elevations, it is remarkably barren and scanty in its vegetation. The name of Salt Range has been given from its productiveness of the rock salt at the mines of Kheura and other places, an account of which has been given (See Salt). The range is known to natives by a variety of names, there are peaks called Kanuh, Kundal, Saidi, Tilla, Bhulla, Kheura, Kas Gabhu, Kas Soj, Sangh and Chitta hills, together with many others both of the Shahpur and Jhilm districts. The Salt Range generally is called "Khawa". This range runs across the Sind Sagar doab between the Jhilm and the Indus, crossing it from east to west, between the parallels $32^{\circ} 22'$ and 33° of north latitude, and $71^{\circ} 30'$ and $73^{\circ} 30'$ of east longitude. It starts with three spurs or prongs one on the east bank of the Jhilm and two on the right, both continue separate as far as the Buna Nalla, which joins the Jhilm river at Darapur and Rasul, and then unite into one range, which continues up to Kalabagh on the Indus.

The Suliman Range. The wild and lawless habits of the tribes inhabiting this range have hitherto prevented anything like a geological survey, little is known beyond what can be observed at the foot of the ranges bordering on British territory, or inferred from considerations of similarity of structure with known ranges.

Delhi, Shekhawati, and Kalayana Hills. On the other side of the Punjab territory, there remains yet to be noticed that series of low hills, from which is derived the mineral wealth of Delhi, Gurgaon and Hissar, they appear to be spurs and offshoots of the extremity of the Aravalli range. The principal hills are the Delhi

hills, in the south-west of the district of the same name, and the Shekhawata hills in Gujraon, &c, and the Kalayana hill, at Dadri, which yields the flexible sandstone, and the gray Nainaul marble. It is among the hills in the Delhi district that the crystalline series of Amangpur occur, and that a white clay supposed to be kaolin is produced. The range of Delhi appears to contain limestones, marble, and some sandstone strata—the sandstones are probably Vindhyan. In Gujraon several clays—white, red and yellow—and mica occur, also hematite and ironstone, and also copper, both at Singhana and in Hissar. Ballagarih yields white and red sandstones, and the mottled, red, and white, and blackish of the “new red” group. Within this district, detached hills are common, particularly in the pergunah of Rewa, but none of considerable size or continuance, the country in the vicinity of these hills will generally be found to be occupied by the Ranghur tribe.

Himalaya The two sections of the Himalaya present almost insurmountable obstacles to communication between the countries which they divide, thereby separating the Boni or people of Tibet from the Hindu family of India, the distinction of climate is not less positively marked, both ranges forming the lines of demarcation between the cold and dry climate of Tibet with its dearth of trees, and the warm and humid climate of India, with its luxuriance of vegetable productions.

To the north of the Eastern Himalaya, in Tibet, lies a vast unknown tract, in which perhaps, ramify the head waters of the Yang-tse-Kiang which is identified by Chinese geographers with the Neag King of Cochin China.

Bolor Mountains, the mountains of Balti, extend for 300 miles, from the sources of the Gilgit and Yasan rivers, from 73° to the 77° E. L., the source of the Nubia river. Bolor produces much gold. The higher mountain range abounds in rock-crystal, which is consequently called the bolor-stone or rock-crystal.

Western Tibet is a highly mountainous region lying on both sides of the river Indus, with its longer axis directed, like that river, from south-east to north-west. It is bounded on the north-east by the Kuenlun chain of mountains, by which it is separated from the basin of Yarkand. On the south-east its boundary is formed by the ridge which separates the waters of the Indus from those of the Sanpu. To the north-west and south-west its boundaries are somewhat arbitrary, unless the political division of the country

be had recourse to, which, depending on accidental circumstances entirely unconnected with physical geography or natural productions, is so liable to change that its adoption would be extremely inconvenient. As limited by these boundaries, West Tibet includes the whole of the valley of the Indus and its tributaries, down to about 6,000 feet above the level of the sea, a considerable portion of the upper course of the Sutlej down to between 9,000 and 10,000 feet, and small portions of the upper course of the Chenab, of the Ganges (Jahnavi), and of the Gogra. Every part of Tibet is traversed by ranges of mountains which have their origin either in the Kuenlun on the north, or in the Trans-Sutlej Himalaya on the south.

Rikshavat, is the Sanscrit name of a mountain, lit. bear-having, (from riksha, a bear, and avat, affix, of possession), the mountain of bears is part of the Vindhya chain, separating Malwa from Kandesh and Berar.

The *Aravali* chain of hills is connected by lower ranges with the western extremity of the Vindya mountains on the borders of Guzerat, and stretching from S. W. to N. E. up to a considerable distance beyond Ajmer, in the direction of Delhi. The range divides Rajputanah into two nearly equal parts forming the division between the desert on the west and the central table land. It would be more correct to say the level of the desert, for the south-eastern portion, including Jodpur, is a fertile country. The Aravali chain divides the tributaries of the Indus from those of the Ganges, and may hence be regarded as a continuation of the Cis-Sutlej chain of the Himalaya, which terminates to all appearance in the plains near Nahan in Sirmur. In like manner, the peninsula of Katiwar may be considered as the southern termination of the Aravali, though separated from it by an alluvial plain being the continuation of the water-shed, and dividing the streams flowing to the Gulf of Kutch or the delta of the Indus from those that flow into the Gulf of Cambay.

Central India, including the provinces of Allahabad and Malwa, is a strongly marked natural division, the country north of the Nerbudda, being crossed from east to west by the Vindhya mountains, between the 22° and 23° of north latitude, and then eastern extremity is continued onwards towards the Rajmahal hills which jut into the Ganges at Sierygully, Pooty, and Pattengottah about latitude 25° 12' north. The Vindhya range, near their western extremity again, is met at right

angles by the Aravali, which run between the 73° and 76° of east longitude, northwards for 200 miles towards Delhi, and thus enclose a triangular tract of table land elevated from 1,300 to 2,200 feet above the sea, which has received the name of Central India. In that central tract the thermometer ranges from 28° in the cold season to 98° in the hot weather, and the rains fall in July, August, and September. To the south-west and west of the Aravali, the Rajpootana countries extend as far as the river Indus, and several of them consist of sandy, inhospitable deserts with few inhabitants round the oases. This tract belongs to tributary princes who have been under British protection since the beginning of the 19th century. It is, like Central India from which it is separated by the Aravali mountains, from 1,000 to 2,000 feet above the level of the sea, the land declining to the west towards the valley of the Indus. Though deluged with rain in the rainy season, from the nature of the soil and the absence of all contrivance to preserve the waters, much of the country remains a desert, Ulwar, Jeypore, Kotah, Bundi and Udepore have very fair land, but Jesselmere, Bickaneer and parts of Jodhpore or Marwar are particularly barren.

Westward of the Jummur and the Aravali range the country is flat, with but few hills, and gradually declining towards the valley of the Indus. The soil is sandy, and covered with saline efflorescence, the water brackish, and far below the surface so that the wells are from one to three hundred feet in depth. The sand-hills of the desert are soon reached but the most interesting object in this arid region, as observed by Colonel Tod, is the Salt river, the Looni, with its many arms flowing from the Aravali to enrich the best portion of the principality of Jodhpore, and distinctly marking that line of ever-shifting sand, termed, in Hindu geography, *Manoos-thuli*, corrupted to Marwar. The Looni after a course of more than three hundred miles, terminates in the great salt marsh called the Rann, which is one hundred and fifty miles in length and about seventy in breadth. This, Colonel Tod considers as having been formed by the deposits of the Looni, and equally saturated saline deposits from the southern desert of Dhat. Dr. Gourn described it as a dead flat, hardly elevated above the level of the sea, and he compared it to an arm of the ocean from which the water had receded, as it is covered with saline incrustations and marine exuvie. Besides this saline efflorescence and brackish water, this tract of country is remarkable for containing many salt lakes, which,

by evaporation during the heat of summer, yield a tolerably pure carbonate of soda, that is much used in the upper provinces. Many alkaline plants are also produced, which, when burnt, yield an impure carbonate of soda exported in large quantities into the more populous districts of Hindoostan. Small oases and large towns are found in many parts of this desert, which is traversed by dry water-courses in every direction, as we learn from Mr. Elphinstone and Colonel Tod.

The northern parts of the tract westward of the Jummur must be excepted from the character of barrenness, as Herat is celebrated for its pasturage grounds, and for the herds of cattle which it supports. The S country also is very fertile.

Nelgherry. At the southern extremity of the Peninsula of India the Nilgiris, and its various branches of the Kunda, Sirpana, and Kotagherri, are the mountain system of greatest absolute elevation in India Proper, and exceeding as they do at several points 8000 feet, are particularly well defined and strikingly prominent on account of their comparatively short distance from the sea shore on either coast of the peninsula.

The Nelgherry mountains are in the southern part of Peninsular India. The Eastern Ghats are not properly a ridge, though the natives so call the first step, which is met with to the west of the Eastern Coast. The mountain tract called the eastern ghats, commences $11^{\circ} 20'$ N. south of the Cavery, extending to 16° N. south of the Krishna river. The western ghats commence at Cape Comorin and extend to the Tapti or Suat river, whence they diverge to the N. E. and are lost among the hills near Boohimpore. The Nelgheries are situated between 10° and 12° N. L. and 76° and 77° E. long. bounded on the north by the Table Land of Dwaraaputnam, S and E by the open country of Combitur, S. W. by the Manna river, a branch of the Bhowera, W. by the chain of ghats and N. W. by the district of Wynaad. The base of these mountains, including that of the Koonlah hills, covers a circumference of 200 miles. Their greatest length is from E. to W. 16 miles, and medium breadth 15 miles. The surface is composed of ridges of different elevations. The country is divided into three Naad, viz. Peruga, Malka and Thodavar Naad. The first two are mountainous but the third is of sloping hills, and a gently undulating surface of table land. Dodabetti is 8700 feet above the level of the sea. The people occupying these Naad, are, 1—Thodavar, 2—Budadagau, 3—Kothur and 4—Koorambur.

MOUNTAINS

The *Travancore group of Mountains*, presents a striking analogy to the Island of Ceylon. They are loftiest at the extreme north of the district, where they stretch east and west for sixty or seventy miles separating the districts of Dindigul and Madurai. Notwithstanding the perennial humidity, the rain-fall at Comitalam is only 40 inches, on the hills around, however, it is doubtless much greater.

The *Pulney or Palmar mountains* are west of Dindigul, the *Animalay* south of Coimbatour, the *Shevaqhar* mountains south-west of Madurai, and the ranges near Comitalam, are all well known. The remarkable Palm, *Bentinckia*, so common in the Travancore mountains, is not known in Ceylon. The other palms are *Caryota uens*, an *Arecia*, *Phoenix lamiifera*, and one or two species of *Calamus*.

Chanda. A hill range in the Maramgaon mandal of the Chanda District, forms the highest portion of a wild mountain region two thousand feet above the sea, on the summit of which, encircled by chain upon chain of hills, all covered with the densest forest, stands far from human habitation, the old fortress of Tepagarh.

The *Continent of Asia* is crossed by a great desert, extending from the Caspian almost to the gates of Pekin and the Yellow Sea. To the south of this wilderness lies a region divided into northern and southern parts by the great chain of the Himalaya, and the lofty Nanling mountains, which run from its eastern extremity to the shores of the Pacific, opposite the island of Formosa. To the north of this mountain wall are Thibet and China, separated by the Yungling mountains, to the south of the same barrier are the plains of Hindustan and the valleys of the Indo-Chinese countries, these two geographical areas being separated by the hills of Ariacan. Beyond the Trans-Gangetic peninsula there is a third region—the Malay archipelago. Thibet is a vast expanse of plains, hills, and valleys, rising from a table land of 15,000 feet in elevation, as lofty, indeed, as the summit of Mont Blanc. Thrown up, *en masse*, within a very recent geological epoch, by some stupendous volcanic force, we find embedded in its soil the remains of animals which still exist in the tepid plains of India. Surrounded on all sides by vast mountain-bulwarks, its lowest elevation seems to be at its south-eastern corner—at the point, in short, where it joins the Indo-Chinese countries, and whence they expand in long mountain-ranges, which spread out like the ribs of a fan as they approach the Pacific.

MOUNTAINS

The *Trans-Gangetic peninsula* mountain system may be compared to an out-stretched hand, of which the thumb represents the hills of Ariacan, the fore-finger the ridge which terminates in Malacca, the little finger the Nanling chain, running through southern China north of Canton, and the wrist, the depressed edge of the table-land of Thibet, from which its waters are poured down into the Pacific, through valleys corresponding to the openings of the outstretched palm.

The *Malay Islands* lie beyond this region and form a third link in the chain of countries which separate China and India. Thibet is a desert of parched and frozen highlands, the Malay Islands are a tropical wilderness, with a hot and moist climate, in which the very exuberance of vegetable life has prevented the formation of civilized societies or a numerous population, while the intermediate countries in the south resemble the Malay Islands on the extreme north of the Thibetan highlands. From the southern slopes of the Himalaya issues the Ganges river, while from the depressed edge of the Thibetan plateau, the river Brahmapoota descends into the highly cultivated and populous plain of Hindostan, studded with historical cities, such as Benares, Delhi, and Calcutta. From the eastern side of the same neck of land there runs, in the opposite direction, the Yang-tse-Kiang, through a broad alluvial valley, expanding into the plain of China, the richest, the best cultivated, and the most densely-peopled region of the globe. The Yang-tse-Kiang, is navigable, by junks of fifty tons, up to the great bend, where it turns eastward.

Till very recently, the whole traffic between China and England was carried on at Canton, by conveying the produce of the interior over the passes of the Nanling mountains, while the traffic between the same central regions and Russia was conducted at Kiachta, a place equally remote, it being beyond the Iuschan mountains and the desert of Shamo.

Khassya Hills. The undulatory eminences of the Khassya country, some 4,000 to 6,000 feet above the level of the sea, are dotted with groups of huge unpolished squared pillars and tabular slabs, supported on three or four rude piers. In one spot, buried in a grove, were found a nearly complete circle of menhir, the tallest of which was 30 feet out of the ground, 6 feet broad, and 2 feet 8 inches thick, and in front of each was a dolmen or cromlech of proportionately gigantic pieces of rock, while the largest slab measured was 32 feet high, 15 feet broad, and 2 feet thick. The

MOUNTAINS

MOUNTAINS.

method of removing the blocks is by cutting grooves, along which fires are lighted and into which when heated, cold water is run, which causes the rock to fissure along the grooves, the lever and rope are the only mechanical aids used in transporting and erecting the blocks. The objects of their erection are various—sepulchre, marking spots where public events had occurred, &c., the Khasian word for a stone, "man," as commonly occurs in the names of their villages and places as that of man, man, Cornwall, &c., thus Mansmai signifies in the stone of oath, Manfloo, the stone of salt, Manfong, the grassy stone, &c., just as in Wales, Penmaen Mawr signifies the hill of the big stone, and in Brittany, a menhir, is a standing, and a dolmen a tablestone, &c. The resemblance of the burrows and their contents with the romlechs, &c., to the Druidical monuments which are discovered in the ancient seats of the Celtic race in Europe, is too exact and remarkable to be accounted for on any other supposition than that of their derivation from the same origin. Hence the people who introduced Druidical rites into India must have brought them with them from Central Asia, and they must have entered India at a period as early as the introduction of Druidical rites into Europe.

The Ava and Malayan Mountains run parallel to the last, being given off from the snow-capped mountains of East Tibet and, though rapidly diminishing in elevation, are continued almost to the equator.

Upon the right bank of the Irrawaddy, the mountains opposite Than Ynn Yova, in lat N $24^{\circ} 36\frac{1}{2}'$, long E Gr $96^{\circ} 31\frac{1}{2}'$, have an average height of from 6,000 to 7,000 ft. One of the highest, the summit of which is visible from the valley, reaches apparently 8,000 feet.

Westward of Let pan Zin Yova, at a little distance from the right bank (lat N $24^{\circ} 27' 2''$, long E Gr $95^{\circ} 56' 15''$), the summits of the mountains attain a height of 2,000 feet.

Heights of 800 and even 1,000 feet are also numerous on the right bank of the river, only 20 to 23 miles north of Shwe-mut-the-phyu (lat N $23^{\circ} 4'$, long E Gr $96^{\circ} 15'$).

The character of the whole river district, including the elevations not above from 3,000 to 4,000 feet, presents a thoroughly tropical appearance. The declivities of the hills, as well as the valley of the river, are covered with the wildest and most diversified vegetation, in the shape of dense tree and grass jungle.

The Yomah Mountains, the central chain of Burmah proper, are extended into Pegu and form the spine, as it were, of the province with the valley of the Irrawaddy on the east and the several minor valleys lying between the off-shoots by which the chain is terminated on the south, as the valley of the Zamayee or Pegu river, the valley of Illaue or Lue river, together with the intermediate valley of the Phoungee river or Paizoondoung creek, lying between the Illaue and Pegu rivers. One of the most southern points of the Yomah lies between the Padoda hill at Rangoon, marking the direction of the chain or line of local disturbance. The most elevated portion of the Yomah chain appears to be that from whence these southern branches radiate, where the Onkkan and Thounza Chonggy rivers, on the east and south, fall into the chain, Di McClelland estimates at about 2,000 feet above the sea, on the west, and the Zamayee and Phamgyee rivers presenting steep, and inaccessible declivities.

Malay Peninsula. The chain which extends along the Malay Peninsula is most conspicuous and is continued at intervals to Banca and Biliton, and perhaps may be traced as far as the north coast of Java. This range abounds in metals, or, at all events, in it mining operations are pursued with great success, probably from the strata, owing to its central position, having been little disturbed by the convulsions which have shaken the countries on either hand. The productiveness of the gold mines of the Malay Peninsula and of the tin mines of Banca is well known. This range may be considered as the back bone of the Asiatic Bank which extends into the Archipelago from the south-eastern extreme of Asia to a distance of nearly 1,000 miles, in fact to within 50 miles of Celebes, perhaps, in the south-west extremity of the Island also, but there is a space of nearly 30 miles across which no soundings have been carried. So great an extent of volcanic action, but not to such an extent as to disturb the direction of its mountain range, which runs parallel to that of the Malay Peninsula. The third and last range that can be traced into the Indian Archipelago is the one that traverses Laos and Cambodia, at the southern extremity of which it disappears for a time, showing itself only at Pulo Condor and Natunas, until it emerges under the north-west extreme of Borneo, and is continued along the entire

MOUNTAINS

west coast of that island. Here it again disappears, and only shows itself again on the north coast of Java, where it ceases entirely. The remaining portion of this Island, with perhaps, a part of the north-east extremity, being either of volcanic formation or of alluvial deposit. It is rather singular that the celebrated teak-forest, which abounds on the Cambodian part of this range, but is not found in Borneo, is again met with here, the projecting part of the north side of Java, between Samarang and Srahaya, being a vast teak forest, from the timber of which the greater portion of the shipping employed in the Archipelago is constructed. Java is the only island in the eastern seas in which the teak-forest is indigenous, nor will it thrive in the volcanic parts of the island where its cultivation has been attempted. This, which may be called the Cambodian range, is also rich in minerals, especially the Bornean part of it, where large quantities of gold and many diamonds are obtained by the miners. The volcanic islands of the Archipelago also contain metals, gold-dust being found at the bottoms of many of the mountain streams, but it does not exist in veins, as in the Malayan Peninsula and the west coast of Borneo, these having apparently been broken up by the violent convulsions to which these Islands have been subjected.

Burma and Tenasserim, the Tenasserim Provinces extend for about six degrees of latitude along the east shores of the Bay of Bengal. In breadth they seldom exceed more than one degree of longitude, but their mountains are of considerable height. From Siam, on the east, these provinces are separated by an interrupted range of mountains, occasionally rising to 7,000 or 8,000 feet high, but their general height to the north is about 4,000, diminishing in passing southwards to 3,000 feet or less. The main direction of this range is north and south, this being also the general direction of the coast line, of the minor and outlying ranges of hills, and, therefore, of the rivers. The geological structure is tolerably simple, although at first sight apparently complicated from the great disturbances to which the rocks have been subjected. The central range is of granite, occasionally, but not unfrequently of a syenitic character, itself traversed by thick veins of large crystalline felspathic granite, and often along its outer edges, or near its junction, with overlying slates, characterized by the presence of tin-stone as an ingredient of the mass disseminated among the other mineral constituents. This granite axis is succeeded by highly metamorphic rocks of a gneissose and micace-

MOUNTAINS

ous character, themselves cut up by numerous veins of granite, which, however, do not extend far from the junction. Upon these is a great accumulation of bluish and bluish-black earthy beds, thinly laminated, of thin-bedded grits, and of pseudo-porphyrific rock, the normal character of which is a hard earthy rock with small irregularly disseminated subcrystalline felspar, passing, on the one hand, into slates, and, on the other, into grits, often coarse and conglomeratic. These harder rocks form all the higher grounds of the outer ranges of hills. This series being best seen in the southern province of Mergui has been previously called the "Mergui" series. The total thickness is about 9,000 feet. It is succeeded unconformably by hard sandstones in thick and massive beds, with thin earthy partings, generally of reddish tints, occasionally deep red and yellowish. A few beds are slightly calcareous, and in the upper portion a few thin and irregular bands of earthy blue limestone occur. Above these rest about 200 feet of soft sandstone in thin beds, upon which apparently rests the massive limestone of the country so largely seen near to Moulmein. The thickness of the entire group is about 6,000 feet, and as some of its members are best seen in the northern province of Moulmein, it has provisionally been called the "Moulmein" series. To determine the age of the older of these two groups (the Mergui) there are no data. The aspect of much of the rocks is very similar to the trappean ashes and felstones so abundant in the Silurian rocks of Great Britain, while others are lithologically like Devonian, but these resemblances are very deceptive. The age of the Moulmein series is, however, tolerably defined by its organic contents. These appear to fix the age of the group as distinctly carboniferous. The whole of these rocks were, subsequently to their induration and disturbance, widely and greatly denuded, and on their upturned edges at intervals is found a series of conglomerates and sandstone and imperfectly coherent shales, with thick beds of coal, generally of lignitic character. None of the conglomerates are coarse, the sandstones are fine, gritty, and pebbly, or clean white quartzose grits, the shales thinly laminated, the coal itself thinly disposed in thin flaky laminae, with earthy streakings marking its structure. In addition to the total unconformity of these rocks, the imbedded organic remains are quite distinct. They consist of dicotyledonous plants (leaves) belonging to the group of the Lauraceae, and probably to the genus *Lauraphyllum* of Goppert. In the thin

MOUNTAINS

paperly shales which overlie the coal are also remains of fish (scales, &c) of a fresh-water character, the whole referring the beds to a very recent epoch, probably corresponding in part to the pliocene of European geologists. It is curious to notice here the absence of any coal in the carboniferous rocks below, and its abundant presence in those newer beds. The total thickness of these beds does not exceed 900 to 1,000 ft. They are never continuously traceable, they occur heaped up against and separated by the projecting ridges of the higher grounds, and must have been deposited when the physical conformation of the country was very similar to that now existing. They appear to be the result of a series of fresh-water deposits, formed in small lake-like expansions along the lines of the great drainage valleys of the country, and to mark a line of general and greater depression between the main ridge of hills dividing Siam from the British dominions, and the outer ridges which occur between this and the sea. The direction of the main drainage of the country is determined by the direction of these ranges, and is discharged into the sea through narrow rocky gorges, which have a direction nearly east and west, and which are due to lines of breakage and dislocation. To this is due the sudden alteration in the direction of the courses of the larger rivers, as may be seen on maps.

Rocks similar to those situated in the Tenasserim provinces extend northwards up the course of the Salween River, and into the adjoining districts of Burmah, to the north-east of Pegu. And, also, close to the capital of Burmah, and stretching nearly north and south, as far as examined, high ridges of metamorphic rocks are again met with, consisting of gneiss, micaceous schists, and highly crystalline limestones, occasionally of a fine white colour, and largely used by the Burmese for sculpture. But the great valley of the Irawady is, throughout a very large extent of its course, bounded on either side by a thick series of rocks, chiefly sandstones but with massive limestones also, which are locally rich in fossils, and which from their evidence, may be clearly referred to the Eocene period. These stretch on both sides of the river as far north as Pughn, beyond which the higher grounds recede from the river banks, but they are in all probability continued thence into Munipoor, and so united with the nummulitic rocks of the Khasia and Cachar-Hills. These rocks have been considerably disturbed and broken, but have a general and prevailing strike nearly north and south, which strike, throughout many

MOUNTAINS.

miles, has determined the general course of the river Irawady. Their thickness is considerable, certainly exceeding 5,000 feet. Above these Eocene rocks, and resting upon them with slight unconformity, is a series of beds of no very great thickness, characterized by an abundance of gypsum disseminated in thin layers and veins, and in the lower beds of which occur the deposit of clays and of vegetable matter, from which are derived the large supplies of petroleum. These rocks are well seen at Senan kyoung ("stream of fetid water"), and are traceable northwards to near Amarapura. In the beds which appear to form the uppermost part of this group, but which may possibly belong to another and distinct series, are found some of the fossil bones of the larger animals which occur abundantly in this district. About forty miles north of Amarapura we again meet with sandstones, shales, and coal, resting unconformably on the metamorphic rocks, and characterized by remains of dicotyledonous trees similar to, if not identical with, those found in the coal-yielding group of the Tenasserim provinces, and which are therefore referred to the same age (pliocene). This series, so far as examined, proved of no great extent or thickness. Of fossils found in Burmah by Mr. Oldham, during his companionship with the Embassy, he notes the following —

Elephant, tusk and lower jaw, Specimens	3
Mastodon, lower jaw, and molar tooth,	3
Rhinoceros tooth,	1
Tapir ? lower jaw,	1
Deer,	1
Sus ? or Merycopotamus, portion of cranium,	1
Gavial, fragments	
Paehydermata, Bones,	35
Ruminants,	10
Crocodile,	24
Tortoise,	31
„ large,	17
Undistinguished,	16

Climatic aspect The weather side of all such mountains as the Andes and is the wet side, and the lee side the dry in inter-tropical India, each side of the mountain is made alternately the wet and the dry side, by a change in the prevailing direction of the wind. India is in one of the monsoon regions. From October to April the north-east trades prevail, they evaporate from the Bay of Bengal water enough to feed with rains, during this season, the western shores of this bay and the Ghauts range of mountains. This range holds the relation to these winds

that the Andes of Peru holds to the south-east trades, it first cools and then relieves them of their moisture, and they tumble down on the western slopes of the Ghauts, Peruvian like, cool, rainless, and dry, wherefore that narrow strip of country between the Ghauts and the Arabian Sea would, like that in Peru between the Andes and the Pacific, remain without rain forever, were it not for the S W monsoon, which prevails in India and not in Peru.

After the north-east trades have blown to the end of their season, which in India ends in April, the great arid plains of Central Asia, of Tartary, Thibet, and Mongolia, become heated up, they rarefy the air of the north-east trades, and cause it to ascend. This rarefaction and ascent, by their demand for an indraught, are felt by the air which the south-east trade winds bring to the equatorial Doldrums of the Indian Ocean. It rushes over it into the northern hemisphere to supply the upward draught from the heated plains as the south-west monsoons. The forces of diurnal rotation assist to give these winds their westing. Thus the south-east trades, in certain parts of the Indian Ocean, are converted, during the summer and early autumn, into south-west monsoons. These then come from the Indian Ocean and Sea of Arabia loaded with moisture, and, striking with it perpendicularly upon the Ghauts, precipitate upon that narrow strip of land between this range and the Arabian Sea an amount of water that is truly astonishing. Here, then, are not only the conditions for causing more rain, now on the west, now on the east side of this mountain range, but the conditions also for the most copious precipitation. The fall of rain on the western slopes of the Ghauts sometimes reaches the enormous depth of twelve or fifteen inches in one day.

These winds of India then continue their course to the Himalaya range as dry winds. In crossing this range, they are subjected to a lower temperature than that to which they were exposed in crossing the Ghauts. Here they drop more of their moisture in the shape of snow and rain, and then pass over into the thirsty lands beyond with scarcely enough vapour in them to make even a cloud. Thence they ascend into the upper air, there to become counter currents in the general system of atmospherical circulation.

Animal Life The elevated towns and villages in Mysore are in great numbers at a height of 2,000 or 3,000 feet (Bangalore 2,949 feet, Srirangapatam 2,558

feet). The Dekhan follows next in order of elevation (Satara 2,252 feet, Amangabad 1,855 feet). In Malwa, Berar, and Bahar, none of the larger places reach the height of 2,400 feet. Seoni 2,133 feet, Sagar 1,880 feet, while the principal stations of the Panjab are lower still (Raulpindi 1,737 feet, Peshawar 1,280 feet). The Himalaya rises, in general, so abruptly above the plains, and the latter, particularly in the western regions, are in themselves of such an elevation, that even in the lower parts of the villages, there are but few, if any, points of less altitude, than 1,000 feet above the level of the sea. In the Himalaya, the number of places inhabited by the natives is comparatively insignificant, while the population reaches its maximum in the rich belt of life rising from 3,000 to 8,000 feet, the traces of man and his dwelling place beginning rapidly to disappear at 11,000 feet and even before.

In some provinces of the Himalaya, especially in Nepal, Kamaon, and Garhwal, many villages are deserted in winter, though, as far as regards their elevation, and the solid construction of the houses, they might very well be inhabited throughout the year. The natives, however, prefer removing to villages less elevated, where they spend the colder months. Chalets (Alpenhütten) are as little used in the Himalaya, as tents in the Alps. The pasture grounds, "Karik," for sheep and bovine cattle, are, for the most part, in low elevations, and at no great distance from the village. In the frontier country bordering Tibet, herds of sheep and goats are used for the transport of merchandize. They are driven over the passes to Tibet, laden with grain (a full grown sheep carrying about seven pounds), and return at the end of the summer with salt and borax.

Of the sanitariums in the Himalaya, Simla is 7,156 feet, Darjiling 6,905 feet, Massuri 6,849 feet, &c. They are at present confined to the outer ranges, at a distance of 40 or 50 miles from the foot of the mountains. Though the interior of the Himalaya would afford, perhaps, many spots more desirable in point of coolness and dryness, the want of roads has hitherto rendered all approaches exceedingly difficult, and to an invalid even dangerous. Chini, a most salubrious place in Kanawar (9,096 feet), has been connected with Simla by a road executed by order of Lord Dalhousie. Also Srinaggar, the capital of the valley of Kashmir (5,146 ft.), has of late become easy of access from several parts of the Panjab. In the summer of 1861 there were in Kashmir about three

MOUNTAINS

hundred visitors, including ladies and children

Of wild animals, tigers ascend to 11,000 ft in the Himalaya, they are not, however, seen in Western Tibet, or the Kuenlun. Leopards may be met with in the Himalaya and in Western Tibet even at 13,000 or 14,00 ft, on the Kidarkanta (12,430 ft). The domestic cat is common in Tibet. Dogs are the companions of the Tibet shepherds, whom they follow over passes exceeding 18,000 ft without apparently any particular difficulty. A greater variety of wild species also exist in different parts of High Asia.

Jackals are found in the Karakorum between 16,000 and 17,000 ft. Hodgson mentions two species of foxes in Eastern Tibet. Wolves are not known to frequent the Himalaya proper, but they are found in Western Tibet, and close to the Karakorum pass (18,345 ft).

The wild yak, the existence of which in the wild state, has been doubted, and the kiang, five to six species of wild sheep and goats, hares and mice are as found high as 16,000 to 17,000. In the Himalaya, the number of species of snakes and frogs rapidly decrease with height, but lizards remain nearly the same between 1,000 to 15,000 ft.

Butterflies are found in the Himalaya to 13,000 ft, in Western Tibet and Turkistan even 16,000 ft, as localities of permanent habitation. Beetles probably follow the highest formation of grassy turf in the Himalaya, as well as in the Alps. The upper limit of mosquitoes is at about 8,500 ft, and the peepers make themselves very troublesome in the Eastern Himalaya during the rainy season as high as 13,000 ft. As in the Alps, the new fields of the glaciers are often covered with the remains of insects carried up by the ascending current to 18,000 and even 19,000 ft. Domestic animals, such as sheep, goats, tame yaks, horses, and dogs, follow man across the highest passes between Turkistan and Tibet, the two-humped Bactrian camel even being used as a beast of burden. When without a load, no difficulty is experienced in bringing these camels even over the steeper passes of the Himalaya. The existence of infusoria seems a little subject to limitation by height in the Himalaya, or the other chains of High Asia, as in the Alps. In a few small fragments, which were chipped off from the rocks on the Ibi Gamn pass (20,459 ft), Prof. Ehrenberg detected their presence, and even found them not insignificant in quantity, he dis-

MOUNTAINS

covered two species new to science. Some of these infusoria displayed a remarkable identity in external appearance with those that had formerly been collected on Monte Rosa.

Vegetation. The extent to which the plants of Europe abound in India has only lately been known, but 222 British species have been ascertained to extend into India, and a multitude of mountain plants, many of them the most conspicuous in Europe, range from the coast of the Levant and the Black Sea to the Himalaya. This is the more remarkable as the Himalaya range is, in idea, rather than really, connected with the mountains south of the Caspian, or with the Caucasian Alps, or those of Asia Minor, for the mountain mass of Asia sinks to the westward of Afghanistan, rising again only in isolated peaks. The *Corylus colurna* (C. laccia, Wall.) ranges from the Levant and the Black Sea to the Himalaya. *Quercus ilex*, *Ulmus campestris*, *Celtis australis* and *C. orientalis*, extend from Spain to the N. W. Himalaya, and the walnut, ivy, juniper, and yew extend from Europe through the Himalaya across China, through Mexico, and throughout N. America. The yew, the juniper, *Aquilegia vulgaris*, *Caltha palustris*, &c. are common to most parts of Europe, Mediterranean flora, Northern Asia, the Himalaya, and N. America.

The *Celtis*, *Quercus ilex*, *Olea europæa*, *Myrtus communis*, &c., of the Mediterranean, are also Himalayan plants. The European plants, however, rapidly disappear to the east of Kumaon, but there is a blending of the European flora on the east of the Himalayan chain, as to the eastwards there is a mixture of Chinese and Malayan forms with that of the Himalaya. Pines, oaks, and other forest trees of Europe and Asia, rhododendrons, and many other magnificent shrubs, abound throughout the Himalayan chain, often on a gigantic scale.

Trees grow very generally in the Himalaya up to heights of 11,800 feet, and in most parts there are extensive forests covering the sides of the mountains at but a little distance below this limit. In western Tibet, however, there is nothing at all corresponding to a forest. Apricot trees, willows, and poplars, are frequently cultivated on a large scale, poplars, indeed, are found at Mangnang in Guan Khoisum, at a height of 13,457 feet, but they are the objects of the greatest care and attention to the lamas. On the northern side of the Kuen-Lun, are

MOUNTAINS

no trees at all, owing to the considerable height of the valleys. In the Andes, they end at about 12,130 feet, in the Alps, on an average, at 6,400 feet, isolated specimens occurring above 7,000 feet. The cultivation of grain coincides in most cases with the highest permanently inhabited villages, but the extremes of cultivated grain remain below the limit of permanent habitation. In the Himalaya, cultivation of grain does not exceed 11,800 feet, in Tibet 14,700 feet, and in the Kuen-Luen 9,700 feet. For the Andes, the limit is 11,800 feet, in the Alps, some of the extremes are found near Fındelen at a height of 6,630 feet, but the mean is about 5,000 feet. The upper mean limit of grass vegetation in the Himalaya is at 15,400 feet in western Tibet, nearly the same level as for the highest pasture grounds, 16,500 feet, may be adopted, in the Kuen-Luen, grass is not found above 11,800 feet. Shrubs grow in the Himalaya up to 15,200 feet, in western Tibet as high as 17,000 feet, and in one instance, at the Gunshanku, even to 17,313 feet. On the plateau to the north of the Kara Korum, shrubs are found at 16,900 feet, and, which is more remarkable, they occasionally grow there in considerable quantities on spots entirely destitute of grass. As an example, may be mentioned amongst several others, the Vohab Chalgane plain (16,119) feet and Bashmilkun (14,207 feet). In the Kuen-Luen, the upper limit of shrubs does not exceed 12,700 feet. Above this height grass is still plentiful, and shrubs being here, as generally everywhere else, confined to a limit below the vegetation of grass, the range presents an essential contrast in this respect to the characteristic aspect of the Kara Korum. The number of species of plants, as well as the number of individuals, is exceedingly limited in the higher parts of the Kuen-Luen. Lichens are completely wanting in the dry angular gravel covering the high plateau, and the slopes of the mountains in their neighbourhood. Two systems of elevation are particularly regular in the central parts of the Kuen-Luen, the steeper one dips north 30 to 50° east, the other south 20 to 40° west. A hard crystalline rock occurs, not unlike pudding-stone, which contains geodes of spherical and angular forms, the quarries where the yashm stone is dug are at Gulbagashen, in the valley of Kara-kash.

In the regions at the base of the mountains in the perennially humid provinces of India, from the atmosphere being more loaded with moisture, the climate is more equa-

MOUNTAINS

ble than that of the adjacent plains, and a warm temperate flora, unknown to the plains, commences at elevations of 2,000 to 3,000 ft, and prevails over the purely tropical vegetation which appears amongst it in scattered trees and shrubs. Amongst other orders may be mentioned Magnoliaceæ, Ternstroemiaceæ, sub-tropical Rosaceæ such as *Prunus*, *Photinia*, &c., *Kadsua*, *Sphærostema*, *Rhododendron*, *Vaccinium*, *Ilex*, *Stylix*, *Symplocos*, *Olea*, *Sapotaceæ*, *Lauraceæ*, *Podocarpus*, *Pinus longifolia*, with many mountain forms of truly tropical families, as palms, *Pandanus*, *Musa*, *Cusciaceæ*, Vines, *Vernonia* and hosts of others.

In the Himalaya, the truly temperate vegetation supercedes the subtropical above 4,600 feet, and the elevation at which this change takes place corresponds roughly with that at which the winter is marked by an annual fall of snow. This phenomenon varies extremely with the latitude, longitude, humidity, and many local circumstances. In Ceylon and the Madras peninsula, whose mountains attain 9,000 feet, and where considerable tracts are elevated above 6,000 to 8,000 feet, snow has never been known to fall. On the Khassya mountain which attains 7,000 feet, and where a great extent of surface is above 5,000 feet, snow seems to be unknown. In Sikkim, snow annually falls at about 6,000 feet elevation, in Nepal, at 5,000 feet, in Kumaon and Gujwal at 4,000, and in the extreme West Himalaya lower still. In the mountains of Ceylon, on the Neilgherries, and on the Khassya hills, the temperate forms of plants are more numerous than upon the Himalaya. Violent winds sweep over the broad grassy undulating tops of the Khassya hills, and hundreds of species common to the Sikkim Himalaya and to the Khassya, ascend higher in the warm forest-clad and sheltered Himalayan valleys at 5,700 feet in Sikkim than they do in the Khassya hills. In the Himalaya, the genera *Rhododendron*, *Monotropa*, *Pedicularis*, *Corydalis*, *Nepeta*, *Carex*, *Spizæa*, *Primula*, *Cerastus*, *Lonicera*, *Viburnum* and *Saussurea*, attain their maximum of development over all other parts of the world. *Ephedra* ranges from the plains of the Punjab up to 16,000 feet in the N. W. Himalaya the genus *Martia* ascends from 3,000 to 8,000 feet in Sikkim, and in the Western Punjab, at scarce 4,000 feet, accompanies *Celtis* and a species of ash. Subtropical *Myrsine* extends into Afghanistan. *Juniperus exelsa*, found as low as 5,000 feet in Afghanistan, ascends to 15,000 feet in Tibet. *Populus euphratica*, a *Cynanchum*, *Chloris barbata*, *Cyperus aris-*

MOUNTAIN LIMESTONE

there appear to be three well defined strata, viz, an upper one of a yellowish blue mixed with disintegrated sandstone, non-pyrites, and chalk, all in their places. Below that a more bluish grey limestone with occasional calcspai crystals again is found, but generally of the same nature as a German lithographic stone. Under the aforesaid strata lies a very dense bluish grey limestone mixed with veins of calcspai. It is not used by native lime burners, as being intractable. This is the lowest stratum, and would be an almost indestructible building or flooring stone from its great hardness, much harder than granite, and approaching to porphyry. It may be had in large blocks, and, if sawn into slabs, would be a very handsome building stone, bluish grey with white streaks, and moreover it would probably make a superior kind of lime. Immense quantities of lime are made from the quarries of the western bank of the Soane, and exported down the Soane and the Ganges as far as Monghyr. Perhaps 300,000 to 400,000 tons are made annually, and the material is inexhaustible. The same limestone rock crops out on the northern face of the range at intervals, between the Soane river and Mizapore, and again, especially in the singular and interesting limestone caverns of Goopteswar in the valley of the Doorgowtee river, at Beetree Band, in Khawah Kobat Mussage, on the Sooreh river, and near Mizapore. With canals and tramways these quarries could supply all Northern India with the finest lime in the world. The cost of the lime at these quarries varies from 6 to 16 rupees per 100 maunds, or, say 5 to 14 shillings per ton. The present system of lime burning is a very imperfect one, and indeed only suited to native wants, but with European supervision, although the material could not perhaps be reduced cheaper, it could be produced with much more certainty and evenness in quality. Close to Jubbulpore is a range of low hills within a circumference of about ten miles, interspersed with masses of limestone both above and below the surface. The fuel generally used and most available for burning the lime is brushwood. It is cut and brought from a distance of 7 or 8 miles. The stone is broken into fragments of 6 to 12 inches in size, then piled like a dome over a hole of about 9 feet in diameter dug in the ground, and a passage left for introducing the fuel. This kiln is kept burning continually for the whole of the day, and the lime removed on the following morning. The fuel is used in the proportion of 40 maunds to every 75 maunds of limestone. Twenty-

MOUNT ARGILLOS

five maunds of the stone yield about 50 maunds of well-burnt lime. The cost of collecting and putting it in the kiln amounts to 3 rupees for every 100 maunds of lime. The fuel costs from 5 to 8 rupees for every 100 maunds of lime. The entire cost of preparing the lime varies from 8 to 10 rupees per 100 maunds. The hills are conveniently situated both as regards the line of railway to Bombay as well as to Mizapore.—*Cal Cat Ex* 1862

MOUNTAIN PEPPER *Capparis sinaca*.

MOUNTAIN SHEEP *Ovis aries*

MOUNTAIN SORREL, *Vide Oxynia*

MOUNTAIN SPINAGE See *Oriache*

MOUNT ABOO The number of peaks which crown this mountain is variously stated. According to Tod, there are six, the most elevated of which is that of Goruknath, having on its summit an area of only ten feet in diameter, and surrounded by a shrine dedicated to Goruknath, each of the other peaks has its shrine. On a small tableland on the mountain, about 600 feet below its summit, is the ancient palace of Khengar and numerous Jain temples. See Aboo

MOUNT ARAFAT, See Adam

MOUNT ARARAT, is called Aghri dagh, it is in height about 16,200 feet. In the last volume of 'Cosmos,' Humboldt records the height of Demavend at 19,715 feet, which is but 1,785 feet under the height attributed to it. According to Humboldt, Ararat is only 17,112 feet high. General Monteith, who passed three years at the foot of Mount Ararat, used many means to ascertain its elevation, and made it 16,090 feet above the level of the Araxes. This is the Mons Macis of the ancients, the Ararat of modern geographers, in the province of Erivan. At a distance, it has a resemblance to a ship. It is called by the Armenians Mountain of the Ark, and by the Persians Mountain of Noah. Aghri-dagh being the name given to it by the Turks, and the Armenians call it Macis. It is called by the Arabs also Jabl-ul-Judi and by the Armenians Massis Sinsai, or Mountain of the Ark. But all unite in revering it as the haven of the great ship which preserved the father of mankind from the waters of the deluge. Berosus and Alexander both declare that in their time it was reported that some planks of the ark remained on this hill, at the date of the accession of the Abbasside caliphs A D 749.—*Porter's Travels*, Vol I, p 183, *General Monteith's Report*. See Iran

MOUNT ARGILLOS Rigyal, Tibetan, mountain king—is the origin of Plutarch's Mount Argillos (*De Fluvius*), the name of the mountain on which Bacchus was born. Rig,

MOUNT BAIBHAR

Tibetan, a mountain, is the same term as mount Righi, in Switzerland. Righyal is one of the trans-Himalayan range. The peaks of this range are from 20,786 to 21,000 feet in height. Its general direction is from South East to North West, and its extreme length is upwards of 350 miles. It forms the natural boundary of Ladak, Balti, and Rongdo, on the north, and Rukchu, Purik, Dias and Astor on the south. Its passes on the eastern half of the range are from 16,495 to 18,746 feet in height, and on the western half, from 12,000 to 16,000.

MOUNT BAIBHAR—In the inscription on the Jain temple here, the name is sometimes written Barbara, and sometimes Vyavahara. General Cunningham thinks, it is the Webharo mountain of the Pali annals, on whose side was situated the far-famed Sittapanni Cave, in front of which was held the first buddhist synod, in 543 B C. This cave, still exists under the name of Son Bhandai, or "Treasury of gold," in the southern face of the mountain, but, following Hwen Thsang's description, it should rather be looked for in the northern face. Ratnagiri is due east, one mile distant from the Son Bhandai Cave. This situation corresponds exactly with Fa-Hian's position of the "Pippal tree Cave," in which Buddha after his meals was accustomed to meditate. It was situated at 5 or 6 li (about one mile) to the east of the cave of the first synod. The hill of Ratnagiri is therefore identical with the Pandao mountain of the Pali annals, in which Buddha dwelt, and which, in the Lalita-Vistara, is always styled the "king of mountains," a paved zigzag road now leads from the eastern side of old Rajagiriha to a small Jain temple on the top of Ratnagiri, which is frequently visited by Jains. He identifies it with the Rishigiri of the Mahabharata. The hot springs of Rajagiriha are found on both banks of the Saisuti rivulet, one-half of them at the eastern foot of mount Baibhar, and the other half at the western foot of mount Vipula. The former are named as follows—1 Gargajumna, 2 Anant Rikhi, 3 Sapt Rikhi, 4, Biakemkund, 5 Kasyapa Rikhi, 6, Byas-kund, and 7, Markand-kund. The hottest of these are the springs of the Sapt Rikhi. The hot springs of mount Vipula are named as follows—1 Sita-kund, 2 Suraj-kund, 3 Ganes-kund, 4 Chandrama-kund, 5 Ram-kund, and 6, Singgi Rikhi-kund. The last spring has been appropriated by the mahomedans, by whom it is called Makhdum-Shah, whose tomb is close to the spring. It is said that Chilla was originally called

MOUNTAIN GOVERDHAN

Chulwa, and that he was an Ahn. He must therefore have been a converted Hindu. To the north east of the old town, at a distance of 15 li, or 2½ miles, Hwen Thsang places the celebrated hill of Girdhara-kuta, or the "Vulture's Peak." According to Fa-Hian, it was 15 li, or 2½ miles to the south-east of the now town. Authorities, therefore, agree in fixing the Vulture's Peak on the lofty hill now called Sula-giri, or the "Rocky mountain," but General Cunningham could not hear of the existence of any cave in this hill—*Cunningham*.

MOUNT CARMEL, a small range of hills, extends six or eight miles inland, in a S E direction from the bay of Acre. Mount Carmel is a termination of the chain of hills commencing at the plain of Esdraelon to the south-east, the extent of which is about eight miles. The Valley of Martyrs and the garden of Ehas are near. The Valley of Martyrs is a very narrow dell open to the sea. Carmel has scarcely a tree of any size upon it but is thickly studded with shrubs. The convent of St Baroldo stood near the head of the valley. The holy fountain of Eljah is close. The cistern seems to have been hewn in the rock, and is about six feet deep full of clear delicious water—*Shinner's Overland Journey, Vol. I, p 101, Robinson's Travels Palestine and Syria Vol I, p 169*.

MOUNT DILLI, a hill on the Malabar Coast, 6 miles from the Ballhapatam river, a conspicuous headland, visible 21 to 27 miles at sea. The small fort on its outer extreme headland is in lat 2° 2' N long 75° 11' E.

MOUNT EVEREST. A mountain upwards of 29,000 feet in height, lies to the west of Kinchinjunga, and is the highest mountain of the world at present known. According to the brothers Schlagentweit, the Nepaules call it Gaurisankar, but the Tibetans to the north call it Chingopamari.

MOUNT FORMOSA, in lat 1° 49' N long 102° 55' E 40 miles east from Malacca, is the highest summit of a group of undulating mountains near the sea.

MOUNTAIN GOVERDHAN, the hindoo Panassus is famed in the legends relating to the hindoo god Krishna. At the age of seven, the legends relate, that he uplifted on the tip of his little finger, the mountain Goverd'han, to shelter the Gopa and Gopi from the wrath of Indra, the Jupiter Pluvius of the hindoo Pantheon, who, enaged with jealousy at the diminution of his votaries and sacrifices, consequent on the adoration of Krishna, attempted to destroy them by a partial deluge. This story is re-

MOUNT KAILAS

presented in the Matsya Purana, whence Sn W Jones has thus poetically introduced it in his hymn to India The bard

"smil'd, and wailing in a softer mode,
Sung the red lightning, hail, and whelming rain,
O'er Gokul green, and Vraja's nymph lov'd plain,
By India smil'd, whose altars ne'er had glow'd
Since infant Krishna mil'd the rustic train
Now thrill'd with terror Them, the heavenly child
Call'd, and with looks unbrosal smil'd
Then, with one finger rear'd the vast Goverd'han,
Beneath whose rocky burden,
On pastures dry, mads and herdsmen trod
The Lord of thunder felt a mightier god"

In pictures of this miracle, Krishna is always represented as a man, attended by his favorite mistress Radha, and sometimes by a multitude of shepherds and shepherdesses, the former with poles, steadying the uplifted sheltering mountain, a shower of rain and fire falling vainly on its summit The legend seems to mean that Krishna had departed from the Vedic worship of India, from which persecutions arose Many of the mountains of India are deemed sacred, by the hindoos, juns and buddhists and great numbers of pilgrims visit them annually John iv and 20 says, 'our fathers worshipped in this mountain,' and Hindoost'han abounds with mountainous places, where hindoos worship

MOUNT MOR, has the grave of Aaron

MOUNT IMAUS The Koh-i-Kaf or Mount Kuf of the Persians is the fabulous mountain, which, according to oriental cosmographers, surrounded the world, but, since the science of geography has made some progress in the east, the name has been confined to Mount Imrus to the east, and Mount Atlas to the west The jan or genn, a race intermediate between angels and men produced of fire, are supposed to have inhabited the earth for several ages before the birth of Adam, and to have been governed by kings, all of whom were called Soleiman (Solomon) They fell into a general state of depravity and were driven into remote places by Eblis (the fallen angel) and such as remained in the time of Kaimeias, the first of the Peshadian dynasty of Persia, were by him driven to Mount Kaf—*Journal Ind Arch*, Vol V, No 9, p 548

MOUNT KAILAS Here, according to Hindoo mythology, lies the city of Kuvera, the Indian Plutus Karachul, a corruption of the Sanskrit Kuvera-chal, is a name of Mount Kailas This mountain in the mythology of the hindoos is regarded as the habitation of the god Siva, the Olympus of Siva and the Celestials It is the Kailas range or Gangri range of mountains in the N W Himalaya, which extends in one

MOUNT MAHABUN

unbroken chain from the source of the Indus to the junction of the Shayok and forms the natural boundary between Ladak Balti and Rungdo, on the South, and Rut' hog Nubra, Shigai and Hunzurgai on the North The Tibetans look upon the Tise or the Kailas peak as the highest mountain in the world The Kailas range has six passes at heights from 15,000 to 18,105 feet Kailas means crystalline or icy, and is possibly the source of the Latin, French, German, and Danish words for ice and glass, glesum, glace, glei, glas, glass, and is itself a compound term derived from ke water, and las to shine

MOUNT LEBANON A mountain in Palestine occupied by the Druse race The Druses are not confined to Mount Lebanon, but are likewise spread over the Haouran, a country lying to the south-east of Damascus Zahle, seven hours from Balbec, belongs to the territory of the Druses Half an hour from Zahle, on the south side of the village of Kerak, is a tomb shown as that of Noali Jaffa or Yaffa, as it is called by the natives, is the representative of the ancient Joppa, so often alluded to in holy writ The timber hewn on Mount Lebanon for Solomon's temple was floated to this port (2 Chron xi 16) Here the prophet Jonah embarked for Tarsish (Jon i 8) Here also Peter raised Tabitha from the dead (Acts ix 42), and Simon the tanner resided In this harbour, Judas Macchabeas burnt the Syrian fleet In modern times, it has acquired a painful celebrity from the twofold acts of inhumanity with which the memory of Bonaparte stands charged, though attempts have been made to attenuate their enormity The hospital where he is accused of having poisoned his sick soldiers, to prevent their fall into the hands of the Turks is now the Armenian convent The scene of the massacre of his prisoners is on the beach, about a mile to the south of the town The tract of country lying between Jaffa and Gaza westward of the mountains of Judea, and distinguished as the plain of the Mediterranean Sea, was the ancient territory of the Philistines, and included the five cities of Gaza, Askelon, Ashdod, Gath, and Ekion This district still bears the name of Palestine and may be distinguished as Palestine Proper Following the line of coast to the south, in the interval between Jaffa and El-Arish, the natural frontier of Palestine is on this side—*Robinson's Travels, Palestine and Syria*, Vol i pp 19, 20 See Lebanon

MOUNT MAHABUN or the Black mountain, is supposed by some to be the Aonios of the Greeks. It is a mountain in the

MOUNT MERU

Pu-Panjal or Mid Himalaya and is forty miles up the Indus from Attock. It is at least fifty miles in circuit and from 7,000 to 10,000 feet high. Aornos was fabled in the Greek camp to have thence defied Heracles himself. See Mahabharaty.

MOUNT MERU A sacred mountain in hindoo legends. The geography of the Vedic hymns confirms the theory that the Aryan race migrated from Central Asia about seventeen centuries before Christ, entered India by the North West, dwelt during the earliest Vedic portion in the Punjab, and migrated or fought their way into Central India during the five centuries that succeeded. From the frequent mention of the Sarasoty and other rivers, we learn that the Punjab became the locality of the Vedic Aryans. The Massagetae occupied precisely that position to which the legends of Mount Meru and its rivers (amongst the rivers the Jaxartes and the Oxus may be clearly traced) point as the cradle of the Aryan race, and the early mention of the Sacae (Sakya) and Bactrians (Yavana) as the principle foreign nations, confirms the supposition that the Aryan race travelled southwards from the high lands of Central Asia, before entering the Punjab. Aryans in the Vedic age were herdsmen and agriculturists and were dwelling in the Punjab. When they had settled in the fertile valleys of the Ganges and Jumna, they had become brahminists and conquerors, founding kingdoms at Delhi, Oudh, Tihoot, Bihur or Bharata, Kosala, Mithila and Magadha, famous in Indian story. In Ceylon is a class of demigods, who, under the name of Yakshyo are supposed to inhabit the waters, and dwell on the sides of Mount Meru, and who are distinguished not only for gentleness and benevolence, but even by a veneration for Buddha, who, in one of his earlier transmigrations, was himself born under the form of a Yakshyo. The malignant spirits of Ceylon are the Yakka, who are the authors of indefinite evil, and the Singhalese have a demon or Samne for each form of disease, who is supposed to be its direct agent and inflictor, and who is accordingly invoked for its removal, and others, who delight in the miseries of mankind, are to be propitiated before the arrival of any event over which their pernicious influence might otherwise prevail. Hence, on every domestic occurrence, as well as every domestic calamity the services of the Kattadia or devil-priests are to be sought, and their ceremonies performed, generally with observances so barbarous as to be the most

MOUNTAIN ASH

revolting evidence still extant of the uncivilized habits of the Singhalese. Especially in cases of sickness and danger, the assistance of the devil-dancer is implicitly relied on. An altar, decorated with garlands, is erected within sight of the patient, and on this an animal, frequently a cock, is to be sacrificed for his recovery. Another kind of demon-worship in Ceylon is a debased form of Buddhism, where the priest or Kipua is the performer.—*Tennant's Christianity in Ceylon*, p. 232. *Wheler's History of India*, Vol. 1, p. 30. See Aryan, Hindoo, Meru.

MOUNT MYEN MO See Myen-mo.

MOUNT NEBO, from the top of this on their return from Egypt, the Israelites first beheld the 'land of promise,' and there, then illustrious chief breathed his last.—*Robinson's Travels, Palestine and Syria*, Vol. I p. 62.

MOUNT OF OLIVES, a hill on the east of Jerusalem, its highest summit is 2,100 feet above the level of the sea.

MOUNT OROD, the burial place of Aaron, is shown over the summit of Mount Hor. See Aaron.

MOUNT OPHIR, in lat. 0° 5' N long. 100° 0' E on the west coast of Sumatra, 24 miles inland, appears by itself like an obtuse cone, separated from the chain of other mountains and may be seen from a distance of 110 miles in clear weather. See Malacca Fort.

MOUNT PARNASSUS See Ophiu Serpent.

MOUNT SINAI A mountain of Arabia, on the eastern shore of the Gulf of Suez 150 miles south of Suez, famed in the history of the Hebrew nation as the district, whence laws for their guidance was communicated to Moses, their leader. It is surrounded by desert, which the wandering bedouins occupy. At the foot of the mountain is the Greek convent of St. Catherine, founded in 1331 by William Bowldesell, the monks of which are kept almost prisoners by the bedouins. The Arabs call Sinai, Jabl ul-Tin. A stone, called tifa by the Arabs, is found near Mount Sinai, it is brittle, with the appearance of pipe clay, and it serves the poor instead of soap, it is also useful in taking stains out of cloth, and in refreshing the skins of asses, being rubbed over them for this purpose in summer time.—*Burkhardt's Travels in Syria*, pp. 394, 488.

MOUNT TABOR, lies to the east of Nazareth.—*Robinson's Travels Palestine and Syria*, Vol. I p. 211.

MOUNTAIN ASH Tang-hi Chinese, *Grewia elastica*.

MOUNT ZAGROS, or the 'hot country,' is the name given to that tract of country which lies between the Tigris and Mount Zagros *Rich's residence in Koordistan, Vol I p 48* See Luistan

MOWAZIN, or Muzzan amongst mahomedans a public crier to summon to prayers

MOW CHOK CHIN A species of bamboo. The most beautiful bamboo in the world, says Fortune, and grows about in wild profusion. In the central and eastern provinces of China it is largely cultivated, particularly on the sides of mountains where the soil is rich, and in the vicinity of temples and other monastic buildings. Its stems are straight, smooth, and clean, the joints are small, it grows to the height of from sixty to eighty feet. Twenty or thirty feet of the lower part of its stem are generally free from branches. These are produced on the upper portion of the tree, and then they are so light and feathery that they do not affect the cleanness of the main stem. In addition, therefore, to the highly picturesque effect it produces upon the landscape, it is of great value in the arts, owing to the smoothness and fineness of its structure. It is used in the making of sieves for the manipulation of tea, rolling ta-

bles for the same purpose, baskets of all kinds, ornamental inland works, and for hundreds of other purposes, for which the bamboo found in India is wholly unsuitable. Like all other species of the same tribe, it grows with great rapidity and perfects its growth in a few months. To use a common expression, "one could almost see it growing." Fortune was in the habit of measuring the daily growth in the Chinese woods, and found that a healthy plant generally grows about two feet or two feet and a half in the twenty-four hours, and the greatest rate of growth was during the night. The young shoots just as they peep out of the ground are highly esteemed as food, and are taken to the markets in large quantities. He was in the habit of using them as a vegetable every day during the season, and latterly was as fond of them as the Chinese are themselves. Sometimes he had them split up, boiled, and dished by themselves, at other times they were used in soup, like cabbage, and they formed one of the ingredients of an excellent omelette. About Hong-Kong and Canton, several kinds of the bamboo are very common. There is a yellow variety with beautiful green stripes, painted on its stems, as if done by the hand of a most delicate artist. But like the Indian varieties, they grow in dense bushes, their stems are not remarkable for their straightness, and the large joints and branches which are produced on all parts of the stem, give it a rough surface, and consequently render it unsuitable for fine work. These tropical, jungly-looking bamboos disappear in the more northern latitudes and in their places we have the mowchok, the long-sin-ehok, the hoo-chok and one or two others, all with clean stems and feathery branches, suited for the most delicate kinds of work, and all "good for food." These bamboos are well worth the attention of people who inhabit temperate climates, such as the south of France, Italy, and other parts of the south of Europe. No doubt they would be well worth introduction to some parts of Australia, New Zealand, and the southern portions of the United States of America. In the province of Chekiang the maximum summer heat is from 90° to 100° in the shade, but it is only for a few days in the months of July and August so high, in winter the thermometer (Fah) is rarely so low as 20. They invariably grow in a rich yellow loam on the slopes of the hills — *Fortune's Residence in China, p 189 Wanderings in China*

MOWE See Marble.

MOU-TAN. CHIN

Mau tan, CHIN | Pœonia moutan,
Tree pœony,

The mowtan or tree pœony, is abundant in China, fruits large, and variegated flowers, it bears the name of hwawang, or king of flowers to indicate the estimation in which it is held. The skill of the Chinese gardeners has made many varieties, but the difficulty of perpetuating them may be one reason for their high price. Tree pœonies are brought south-wards in large quantities every year, about the month of January, from the northern provinces. They flower soon after they arrive, and are rapidly bought up by the Chinese to ornament their houses, after which they are thrown away, as they do not thrive well so far south as Canton or Macao, and will not flower a second season. They are sold according to the number of flower-buds they may have upon them, many of them fetching rather high prices. Several very valuable varieties of the Moutan, or tree pœony, are to be found in gardens near Shanghai. Those varieties of this flower, which are yearly brought from the northern provinces to Canton, and which are now common in Europe, have blossoms, which are either rose-colored or white but in some parts of China purple, blue, and yellow varieties are produced, although these were never brought to Canton for sale. Amongst them from Soochow fifty miles from Shanghai there are lilacs and purples, some nearly black, and one which the Chinese called "the yellow" which, however, was only white with a slight tinge of yellow near the centre of the petals. — *Williams' Middle Kingdom*, p 285 *Tourture's Wanderings*, p 135-134

MOZAIC GOLD or Bronze Powder is a bisulphuret of tin, formed by heating the peroxide with its weight in sulphur. It is produced in small, soft, shining flakes, of a golden yellow colour. It is much used for ornamental work, particularly paper hangings — *Waterston, Faullae*

MOZAMBIQUE The Indo-African sea, is that portion of the Indian Ocean extending from its N W boundary to the Mozambique Channel and including the Persian Gulf, Arabian Sea and Red Sea. It has had much influence on the ethnology of Eastern Africa. The corresponding eastern portion of the Indian Ocean may be termed the Indo-Australian Sea. Important ethnical considerations—relating to the oceanic winds make it necessary to distinguish these two regions from the middle one, thus with the districts of the Indus basin, the marginal district of Beluchistan, the great longitudinal one formed by the Persian Gulf and the basin of the Euphrates, the southern Arabian district, that of the Red Sea, and the marginal or Trans-Nilotic one of E Africa, form the next region. Of these basins the Euphrates and the Red Sea are of especial importance, for by them the ancient civilization of the Mediterranean and the Nile spread their influence into the Indian region, while the Euphrates was itself the seat of a great archaic development of intellect and art.

MOZOME ANGAMI, a rude pagan tribe on the hills of Assam, on the eastern frontier of the Mikir and Cachar. See India, Naga.

imbricata, D C, Sylhet
monosperma, D C, all British India
nover, Buch, Bengal
primitus, Hool, S E Asia, Archipelago
utilis, Wall, Australia, Mauritius

The species are climbing herbs or shrubs, with pinnately-trifoliate leaves and axillary racemes, which hang down when bearing fruit A product of species of *Mucuna* is the cowage,

Kanchkuri,	Dik	Atmagupta,	SANS
Cowage,	FR	Kosambi wall wail	SINGH
Kuhkhatze,	GER	Puney kah	TAM
Kiwach,	HIND BENG	Pilladugukulu,	TIL
Rawe,	JAV	Enuga dola-Gunda,	"

Cowage is probably a corruption of the Arabic, Hindustanee or Bengali names of one of the plants that produce it, it consists of the hairs found upon the pods of different species of *Mucuna* They are exceedingly slender, brittle, and easily detached, and the fragments readily stick into the skin and produce an intolerable itching, hence they are frequently employed for mischievous purposes Cowitch is also used medicinally as a vermifuge, by being mixed with syrup till of the consistence of honey, and given in doses of two or three tea-

MUCUNA PRURITA

spoonsful The species are found in hedges, thickets, on the banks of rivers, and about water-courses, in the East and West Indies, and in America within the tropics. *Mucuna* *mens* and *M. pruriens* usually furnish the substance, but that from *M. monosperma*, called by the Teluga, Enooga dola Grunda, or Elephant's Scratch-wort, is said to exceed the others in the irritating burning property of its hairs. Dr Roxburgh states that *M. pruriens* was one of the plants formerly used in India to poison wells but it is less hurtful than was supposed—*Dis Roxb Fl Ind Voigt*

Grows all over British India and in the Moluccas. It has large purple flowers. Thus when cleared of the small hairs which cover it is eaten by the Natives like other beans. Rheede says that on the Malabar Coast it is supposed to have the effect of exciting venery. The stinging hairs as well as those of *Rottlera tinctoria*, are used in India as an anthelmintic, Sir W. Hooker has distinguished the East India plant, *M. pruriens* from *M. pruriens*, which is indigenous in the West Indies. The pods when ripe, are of a brownish colour, and covered with innumerable sharp prickly-like hairs, which penetrate into and irritate the skin. They dispel lumbrici and ascariides by sticking into their bodies, when pressed against the intestines, and thus irritating and dislodging them. The pod being dipped into treacle or honey, have the hairs scraped off until they have the consistency of an electuary

MUDA-MALLAI

when a table-spoonful may be given to adults, and a tea-spoonful to children, followed by a purgative of castor oil, &c. A cowhage is very common in the Karen jungles. In the Punjab the seeds are principally used in special diseases and given with milk. The hairs of the pods are not used as anthelmintics in India, as they are in England for round worm. They have been applied externally for paralysis and produce much itching. The seed is said to absorb the poison of scorpions and to remain on a bite till all is removed—*Roxb Fl Indica Voigt Powell's Hand-book, Vol I p 341 Royle Mason O'Shaughnessy, Ainslie, p 244*

MUCUNA URENS See Cowhage

MUCUNA VENENOSA, is the name given to the plant producing the poison ordeal bean of Old Calabar. *Mucuna* *Balfouriana* of Old Calabar, resembles a *Tianquebar* species.

MUCUNDA During the life time of the emperor Akbar many hindoos believed him to have been a hindoo in a former birth, that he enclosed in his body the soul of a devout brahmin, who had in a past age borne the name of Mucunda, and had taken a fancy to become the emperor of India. In nine months after his death, Mucunda was permitted to generate in the womb of sultana Hamida Banu, and to take his birth at Amritcote in the character of Akbar. Indeed there were some grounds for the hindoos to claim Akbar as a prince of their race, that emperor had a hindoo wife, the princess Jodhi Bai, had a hindoo daughter-in-law, the Maiwarce wife of Jehangir, had a hindu general, the raja Man Sing, had a hindu financier, the rajah Soder Mull, had a hindu favourite the rajah Beerbul, had a hindu songster, Tausen, had many hindoo officers and hindoo pandits always about him, much in his court savoured of the hindoo, and he had in a manner hindooized himself by his ardent devotedness to the cause of hindoo welfare—*T of Hind Vol I p 311*

MU-DAING, Burm *Cycas encinalis*, *Linn*

MUDANI, a mahomedan sect, founded by Mudan, a sufi. They admit the divine mission of Mahomed, but disclaim his title to particular veneration. The Mudani go nearly naked, braiding the hair and smearing the body with ashes, and wearing iron chains round their waists and necks.

MUDAR, also Ak HIND Are names applied to the *Calotropis gigantea*, the gigantic swallow-wort, a plant which is widely diffused throughout the southern provinces of the peninsula of India where it grows wild, preferring poor soil near the sea. It is replaced in the Bellary District, by *C. procera*, which is equally common and in Northern India by *C. Hamiltonii*. To obtain the fibre the branches are gathered and dried in the sun from twenty-four to thirty-six hours, when they are taken up, the bark peeled from the woody parts, and the fibres gathered. If plied out in the dew for a night, they lose their greenish tint, and become white. The sap of the Mudar plant is applied externally as a rubefacient, dried, it is mixed with caoutchouc.

MUDAREEA, or Subgateca, a class of fagaces

MUDARI CAN Antelope *Arabica* — *Hemipneuste*

MUD BAY or Muddy Bay, is the commercial port of Alleppe in the kingdom of Travancore, 36 miles south of Cochin, remarkable for the singular natural break-water formed in the open sea, consisting of a long and wide bank of mud, the effect of which is so completely to break the waves, that ships of all sizes can securely anchor even at the stormiest season of the year in the open roads, where the water is perfectly calm. The origin of this deposition of mud, has never been satisfactorily accounted for. It imparts a dirty colour to the water and makes it thick and slimy. It has shifted more or less within the last century, but not to any great extent. A similar deposit exists at Nairakul about 29 miles north of Cochin, and the advantage of this latter place, as a natural open harbour for shipping has recently been brought to the notice of the British Government — *H D*

MUDDIKPOR, Kili-kati or Kotaboo,

the wandering minstrels. Other names have been given to this migratory people who dwell in the southern Mahratta country, Kabilgar or Ferryman, Koli and Barkun are the terms most usually employed, but Muddikpor is the designation they apply to themselves. They are generally tall and powerful men, with an olive yellow complexion and are numerous throughout that part of India, they say that their original locality was the village of Talicot near the town of Sorapoor, and that however far they have dispersed, all classes continue to speak the Mahratta tongue though it is requisite they should attain likewise a knowledge of the language of the countries in which they wander to enable them to gain a livelihood.

MUDRA RAKSHASA, or Signet of the Minister, an ancient political Sanscrit drama by Visakha Datta perhaps of the 12th century. The events dramatized relate to the history of Chandragupta, the Sandracottus of the Greeks. Rakshasa was the minister of Nanda and afterwards of Chandragupta. In one scene Vradha Gupta visits Rakshasa and a conversation ensues which relates to historical events,

Rak — What news from Pashpur ?

Vr — I have not much to tell sir, where shall I commence ?

Rak — With Chandragupta's entry in the city. What'er my agents since have done, inform me

Vr — You will remember, Sir, when, in close league,

United by Chanakya, Parvateswara

And Chandragupta in alliance, led

Their force against our city,—a wild multitude

MUDUNA-MOHANA

Of Sakas, Yavanas and mountaineers
The fierce Kambojas, with the tribes who
dwell
Beyond the western streams, and Persia's
hosts
Poured on us like a deluge * * *

In the Mudia Rakshasa, Chandiagupta is frequently named Vishula, a term said to be equivalent to sudia, and Nanda himself was the son of a sudia woman, there can be little doubt that the celebrated Munya family were of sudia extraction. The Uttara Rama Chentia, the Vikrama and Uivasi, and the Mudia Rakshasa, contain many illustrations of the hindoo woman's love and affection. In the latter piece occurs an example, in comparatively humble life, of the strong affection of a hindu wife. Chandina Das, like Antonio in the Merchant of Venice, is doomed to die, to save his friend. His wife follows him to the scene of execution, with their only child, and the succeeding dialogue ensues—

Child—Withdraw, my love, and lend our boy
along

Wife—I forgive me, husband,—to another world
Thy steps are bound, and not to foreign
regions,

Whence in due time thou homeward wilt
return,

No common farewell our leave-taking now
Admits, nor must the partner of thy fate
Leave thee to trace thy solitary way

Child—Whither dost thou me in?

Wife—To follow thee in death

Child—Think not of this—our boy's yet
tender years

Demund affectionate and guardian care

Wife—I leave him to our household gods, nor
fear

They will desert his youth—come, my
dear boy,

And bid thy sire a long and list farewell
Thus could I sweetly pass a thousand
years,

Another author makes a loving woman
say—

But without thee e'en heaven would lose its
charms

* * *

"Pleased to embrace thy feet, I will reside

"In the rough forest as my father's house

"Void of all other wish, supremely thine,

"Permit me this request—I will not grieve,

"I will not burden thee—refuse me not

"But shouldst thou, Raghava, this prayer deny,

"Know, I resolve on death"

MUFTI In British India, an officer of a law
Court

MUG, a term applied, by the people of
India, to all the Asiatic and to a class of
people in the Chittagong district who call
themselves Raj Bansi in Bengali, and
Myama gyeem Burmese, doubtless off-spring
of Bengalee women by Burmese. Their dress
and language is Bengalee, but they are of
buddhist faith. The Asiatic Mug are a
highly Bengalisised class of Rakhoing and
call themselves Myama gyi or great Myama.
This race form six-tenths of the native po-
pulation of Asiatic, one-tenth being Bur-
mese and the remainder Hindu. The term
Mug is not known to the Asiatic them-
selves and Wilson says the term Mugh which
the British have given to the Asiatic by
that people is restricted to the descendants of
Asiatic by Bengali mothers.—*Wilson's
Glossary*

MUGA HIND One of the silk-worm
moths of British India. The two principal
indigenous varieties of silk are the muga and
the eri. A dress made of muga is prized
beyond all others, by the Assamese. A plant
grows wild in the southern part of the
Chittagong district, on which the moth lives.

MUG-DYE-PLANT The Mug make
yellow and red dye, by grinding this plant
and its roots into powder, and boiling the
same in water. The colours are dull but seem
to last for a long time.

MUGGAR-PEER, on the Crocodile-pond,
lies to the north-west of Kmrachee. The
great pond is about 300 yards in circum-
ference, and contains many little grassy
islands, on which the majority of the croco-
diles (*Crocodilus palustris*) bask, some are
seen asleep on its slimy sides, others half-
submerged in the muddy water while now
and then a huge monster raises himself upon
its diminutive legs, and waddling for a few
paces, falls flat on his belly. The water in
the pool feels cold, although fed from two hot
springs, one of which is of so high a tem-

peratune that a visitor could not retain his hand in it yet animal life exists, for, where the water bubbled up from its sandy bottom, and in the little lake running to the tank, is an abundance of a small black spiral shell, very like *Melania pyramis*, an allied species of which frequents the river Jordan. The crocodiles dig deep in the sand under the neighbouring date-trees and there deposit their eggs. Quantities of deciduous teeth of various sizes, are strewn along the slimy sides of the pond. A guide, taking piece after piece of flesh, dashed it on the bank, uttering a low growling sound at which the whole tank became in motion, and crocodiles splashed through the shallow water struggling which should seize the prize. The shore was literally covered with scaly monsters, snapping their jaws at one another. They seize their food with the side of the mouth, and toss the head backward, in order that it may fall into the throat — *Adams*

MUHABAN The Judoon clan inhabit a tract below the Hussunzye country and on the right bank of the Indus opposite the British town of Torbela, and thence stretching westward. In this tract the most notable place is Mount Mahabun, of classical

celebrity. Near the base of Muhabun, and on the bank of the Indus, is the fanatic colony of Sitana. The Syuds of this place are the remnant of the followers of that extraordinary adventurer, Syud Ahmad, who, gathering a handful of mahomedan devotees, from various parts of India, raised a formidable rebellion in Peshawar. After winning and losing Peshawar and Eusufzye, the Syud was eventually slain at the mouth of the Kaghan glen by Sher Sing, the son of maharajah Runjeet Sing. Most of his adherents, chiefly foreigners to the Punjab, dispersed, and the remainder settled at Sitana, evil-intentioned people who endeavour to rouse the bigotry of the surrounding mahomedan tribes, and especially of the Swat. One of the rulers of Swat was elected to his position from among these very people. They intrigue with the Wahabee fanatic religionists among the mahomedan population in various parts of India. More than once correspondence relating to them has been intercepted. In 1852, they co-operated with the Hussunzye against Jehandad, and seized a small fort belonging to that chief, but evacuated it on the approach of a British force with Colonel Mackeson.

MUHAMAREE SANS From maha great, and mee, to kill, the Asiatic plague

MUHAMERAH See Kab Muhammerah

MUHAMMADAN, a term applied to the followers of Muhammad whose name is also written Mahomed and that of his followers mahomedan and then doctrine mahomedanism or islamism, the last term meaning the saving faith. The muhammadans of India are divided into three great sects, the Suni, the Shia and the Wahabi. The last of these are the reforming party in Islam, consisting of zealous and generally of conscientious men, men of piety in whom the religious instinct is strongly developed, and whose one rule in life is what they consider to be their religious duty. Like the Reformers in Europe they refuse to accept any intermediate interpreters between themselves and their Scriptures, and go back to the Koran direct for their doctrine and faith. Unfortunately, however, the Koran is not suited for the exigencies of a modern nation, but only to the local necessities of a warring Arabian tribe, in its successive vicissitudes as a persecuted, an aggressive, and a triumphant sect. The rugged hostility and fanaticism of the Koran have been smoothed down by many generations of scholars and interpreters, and from its one-sided passionate bigotry, a not unsymmetrical system of civil polity has been evolved. Such Laodicean casuistry the Wahabi indig-

nantly reject. They insist on a return to first principles, and wherever they have conquered, then triumph has been subversive alike of settled Government, and of the established muhammadan faith. The Wahabi of India do not go, in questions of doctrine, to the extreme lengths of the Arabian followers of Abdul Wahab. Then first great Indian leader, Sayyid Ahmad, who had been a trooper in the nawab of Tonk's service, was a politician before he became a religious enthusiast. It was not till he required the armed co-operation of his countrymen that he became a seer of sights and a dreamer of dreams, and the British were very much to blame for the remissness and indifference with which they permitted him to recruit his followers in their territory. Ranjit Singh, against whom the jihad or religious war was directed, was then their friend, and whatever may have been his general faults as a ruler, the only grievances which the muhammadans had against him were his interdiction of certain points of ceremonial, and his prohibition against killing cows. The Wahabi of India, therefore, have from the first been rather a political party than a religious sect. Subsequent pilgrimages to Mecca by their leading preachers, have, however, imparted a religious character to the movement which was wanting at first, and such preachers have generally returned from Arabia, ardent, if not very well instructed, disciples of Abdul Wahab. Of late years the religious element has constantly gained strength, and recent political prosecutions have brought them forward as the unshrinking and unselfish devotees of Islam. Since 1865, when it first became really dangerous for a respectable muhammadan to subscribe to the rebellion against the British, the sect has been still further isolated, and has been at the same moment deprived both of the support and of the restraints of the well-to-do comfortable classes. A schism has thus sprung up, and practically Indian muhammadans are now divided into two great sections, the first of which comprises the Shia and Suni, men with vested interests, who are naturally on the side of established Government whether political or religious, and the Wahabi or reforming party, under whatever name they may be known, with their uncompromising and fanatical leaders, and the vast ignorant and superstitious multitude who have nothing to lose and everything to gain by a civil tumult. About the year A. D. 1870, the influence of their itinerant preachers was marvellous. A Wahabi missionary has been seen to halt under a Pipal tree at noon

and before evening the whole town had flocked to him, and were listening to sedition, within the compound of the Commissioner's house, where he had rested with his pony during the heat of the day. About that year, in one of the Eastern Districts, a rumour spread that a Wahabi preacher had fixed his head quarters in a certain desolate and remote hamlet and would preach there forthwith a great encampment formed around him to the number of 6,000 men. The preacher fulminated against the idolatrous rites and priestly superstitions of his countrymen in Bengal. Such merely spiritual declaration was by no means what the people had come out into the wilderness to hear. The result was that before the police had arrived in sufficient force to disperse what was reported by the Hindus to be a seditious encampment, the disappointed multitude had scattered, and the constables found the apostle absolutely alone, and dependent for a little rice and milk on the Hindu villagers who had rushed to the magistrate's court to complain against him. Of the two recognised sects the Shia take up a ground of their own touching the duty to wage war against the Queen, as they do on all other points. The sect have never been very numerous in India, and have been accustomed to persecutions under the orthodox muhammadan governments such as no British ruler would sanction. The Suni form nine-tenths of the muhammadans in India. But the Shia, although not a numerous body, have contributed some of the greatest names to the history of India. The key-note to the Shia faith is the belief in the twelve Imams, an inspired Apostolic descent from Mahomed. One Imam yet remains to complete the august line. By one sect, it is believed that this Imam, the Imam Mehdi, is at present hidden away from sinful mortals, but there will come a great Epiphany or shining forth of the Promised One, when all wrongs shall be righted, and all men converted to the true knowledge of God. 'When that innocent Apostle,' says a Pamphlet, 'shall appear, is known only to the All-knowing God, and to no one else. Till then, the Shia argues that it would be vain to attempt by mortal efforts, or rebellions, or wars, to bring about that great consummation. It denounces as schismatics all who disagree with this view. 'Now a days, such of the depraved and seditious as are ignorant of the precepts of Muhammad and strangers to truth, with vain desires improperly indulge in foolish talk about the meaning and duty of Holy War.' 'In this country, Hindustan, only two sects among the followers

of Islam have proved orthodox—the Shia and Suni. The remaining tribes of musalmans, whether they belong to the sect of Wahabi or to the sect of those who are styled Farazi, &c, are such as have wandered from the right path, and cannot be relied upon. Seven conditions must be fulfilled in order that a jihad, in its meaning of Holy War against the infidel, may become lawful. 'First, when the rightful Imam is present, and grants his permission. Second, when arms and ammunition of war and experienced warriors are ready. Third, when the Jihad is one against mutineers and enemies of God. Fourth, when he who makes Holy War is in possession of his reason, when he is not a lunatic or a man of impaired senses, and when he is neither sick, nor blind, nor lame. Fifth, when he has secured the permission of his parents. Sixth, when he is not in debt. Seventh, when he has sufficient money to meet the expenses of his journey and of the inns by the way, and to pay for the maintenance of his family.' Putting aside the expediency of waging war against Great Britain, and without any reference to the chances of its failure or success, the great Shia condition required for a Holy War is the presence of the Imam. Hitherto this divine leader has withheld his face from mortal men and has not appeared to lead the armies of the Faithful. Till his shining forth, any attempt at Holy War is presumptuous and sinful. To commit bloodshed, except under the leadership of that Imam in person, is strictly forbidden by the Shia law. Those are the rebels and sinful ones who would revolt without the Divine sanction of the Apostle. The Suni have again and again declared holy war without the rightful leader, and with them the Shia have a long account of persecution and martyrdom to settle. The Indian Suni and Shia alike believe in the eventual triumph of the True Faith. But the Suni hold that in the latter days they will carry out the injunction of the Prophet in its entirety, and subdue the whole world to Islam. The Shia, on the other hand, maintain that when that triumph comes, it will be achieved by an amalgamation (although a one-sided one) of the two great religions Christianity and Islam. This dream of universal fraternization in the last days is common to all religions of the nobler type. The hindus have a Book of the Future which foretells a time when all men shall be of one religion and of one caste. Even the Vishnu Purana, compiled in the triumph of hinduism over buddhism, admits that in

the last Iron Age to which we have now come, men shall obtain the liberation of their souls, not in virtue of their religion or their race, but by purity of life and rectitude of action. The Shia musalman have also their millennium, but it is to be reached in association with the christians, who will all become Shia, and probably through the blood of the Suni heretics, who at first will refuse to accept the final Apostle. 'It is distinctly laid down in the Muhammadan Law,' 'that at the time when the above-named Imam shall appear, Jesus Christ may safely attend him' shall descend from the Fourth Heaven, and friendship, not enmity, shall exist between these two Great Ones. It is satisfactory to learn, therefore, that at least one small sect of muhammadans are not bound by the first principles of their religion to rebel against the christian ruler of Great Britain. The Shia all over the world, except in Persia, have been a persecuted people, and, like other hunted sects, have developed a system of easiness to save their bodies by something very like a denial of their faith. When put to straits by their Suni persecutors, they smooth over the peculiarities of their belief. In extreme peril, as lately in Syria, and from time to time in India, this law of extension, or religious compromise, has allowed them to denounce their most cherished tenets, and even to curse the twelve imams. But under the British Power they have been protected from persecution, and from the temptation to insincerity to which persecution gives rise. The Suni are the most numerous class of Indian musalman, they have been conspicuous in proclaiming that they are under no religious obligation to wage war against the Queen of England and Empress of India. To that end they have procured two distinct sects of legal decisions, and the Muhammadan Literary Society of Calcutta has summed up the whole Suni view of the question in a forcibly written pamphlet. It contains two separate sets of syllogisms starting from contradictory premises, yet arriving at the same desirable conclusion. The Law Doctors of Northern Hindustan set out by assuming that India is a country of the enemy, and deduce therefrom that religious rebellion is uncalled for. The Calcutta Doctors declare India to be a country of Islam, and conclude that religious rebellion is therefore unlawful. It is not however, the well-to-do mahomedans, but the fanatical masses, who stand in need of such decisions. The powers of arrest granted by Regulation III of 1818, to enable the Executive to deal

with widely spread treason, such as has from A D 1830 to A D 1870, been smouldering in Bengal, and from time to time bursting out in conflagrations on the Punjab border, have rendered any dabbling in rebellion a most perilous pastime — *The Indian Muslims Are they bound in conscience to rebel against the Queen?* By W W Hunter, L L D, of the Bengal Civil Service

MUJALLIBAH, also called Makloubah, ruins on the east bank of the Euphrates, $4\frac{1}{2}$ miles N N W from the bridge of Hillah, and $1\frac{1}{2}$ north of the Amiam Hill Makloubah means overturned Near the Mujallibah, are the remains of Kasr, as well as those of the hanging gardens, and at rather more than six miles from Hillah, standing amidst, and crowning the summit of, extensive masses of ruin, is the Birs, or Bais Nimrud This has been considered by Niebuh, Rich, and others, to be the celebrated temple of Belus, and, according to Herodotus, it was separated from the palace by the river (Lib 1 clxxx) L'un [des quartiers] est remarquable par le palais du roi, et l'autre par le lieu consacré à Jupiter Belus The Kasr ruins near Hillah, 750 yards from

Amram Hill The Majallibah is a solid quadrangular mound, the sides of which face the cardinal points. Its height is not more than ninety or a hundred feet in the loftiest part, but Sir R. Porter assigns to it that of one hundred and forty feet. It is called by the natives El Majallibah, "the overturned," also Haroot and Maroot, from a tradition handed down, with little deviation, from time immemorial. This solid mound is regarded as the remains of the tower of Babel, an opinion adopted by Major Rennell. As the Majallibah rises to view, it is seen to overtop the intervening banks of several dry canals. It consists of an immense extent of low rounded mounds, of the same nature as that upon the right or west bank of the Euphrates, called the Bursi Summit. On the left bank there is, first, the Majallibah, secondly, directly south of it is the Kasi, a heap of buildings, supposed to represent the great imperial palace with the hanging gardens, close to which is a considerable mass of mounds, which some imagine to be a smaller palace. Still further south is the hill of Amram, a more extensive, though less lofty mass than the last, which must comprise the reliques of many and important edifices. To the E N E at the distance of about six miles from the Majallibah, is an insulated and lofty conical mound, named Al-Hermei, and, lastly, a considerable conical mound, called the Tacho, and by some considered to be the N E angle of the ancient city, stands about fifteen miles to the north of those just enumerated. There are, besides, a vast number of inferior heaps, some of which indicate the courses of canals that irrigated the country, or supplied distant quarters of the city with water, and some are the remains of ramparts which probably inclosed and defended the principal edifices.—*Major Rennell, Mignan's Travels*, p. 10, 161-162.—*Herodotus lib.*, cclxxx

MUKRAN or Mckian, has a population composed of wandering tribes, its natives on the sea-coast are of larger proportions and blacker complexions, than the northern ones, a circumstance that may probably be attributed to their frequent intermarriages with the negroes of Muscat and Arabia, but the Mukran are a pure and delicate race when compared to the Beloochee or Bihooe, owing perhaps to the climate, and their sensual lives, for which both sexes are notorious, they likewise drink great quantities of an intoxicating beverage, made from fermented dates The women of Mukran are, usually, very ugly, and proverbially unfaithful, they set no bounds to the gratification of their passions, at an early period of their lives, they are tottering under decrepitude and premature old age The men do not seem to be remarkable for longevity The great bulk of the population of Kutch Gundava are Jet'h or Jut—*Pottenger's Travels Beloochistan and Sindh*, pp 306 310

MUKRU, HIND Machilus odoratissima

MUKSHA, SANS from mooch, to liberate The hindoo theologic opinion, known as muktant is one species of muksha or liberation, as kaivulya is another they both mean absorption, excluding every idea of separate identity—*Ward's View of the Hindoos* Vol. IV p 361

mahomedans, as Suraj ul Mulk, Shari ul

MULKAH, a stronghold, near the Maha- bin mountain occupied by Mahomedan reli- gious fanatics from Hindustan. It is situat- ed on one of the southern spurs of Mahabun Major James, C B, Commissioner of Pesh- wai, induced the Boner tribes not only to surrender after the havoc done among them but to send a contingent of two thou- sand men with the Corps of Guides to burn down Mulka. Thus, the elder branch of the Eusufzai repeated the vengeance which they once before took on the fanatics when in May 1831 then fathers rose against Syud Ahmed the founder of the sect, who was then slain at Balakot on the Indus, drove his family to take refuge with the nawab of Tonk who long sheltered them, and expelled his Ghazee followers

MULLOH, a pass in Beluchistan The Bolan pass on the borders of Saharawan, leads from the Dashti-i-be-dowlut to Dadur, and is the great route of communication between the Western Afghan provinces and the countries opening on the Indus. It is a continuous succession of ravines and gorges. The air in the lower part of the pass is in summer oppressively hot and unhealthy. It extends from $29^{\circ} 30'$, $67^{\circ} 40'$, to lat $29^{\circ} 52'$, long $67^{\circ} 4'$ — 55 m, or $\frac{1}{2}$ m wide at entrance. The entrance is 800 ft, Ab-i-goom, 2,540, crest, 5793 ft. Average ascent, 90 ft per mile. The Bolan pass with the Mulloh pass, far to the south, are the only level routes intersecting the great chain of mountains, defining, on the east, the low countries of Kach Gandava and the valley of the Indus, while westward, it supports the elevated regions of Kelat and Saharawan. There are many other passes over the chain, but all of them from the east have a steep and difficult ascent, and conduct to the brink of the plateau or table-land. Such are the passes of Takari and Naghow, between the Bolan and Mulloh routes, and there are others to the north of the Bolan. This pass is no less important, as occurring in the direct line of communication between Sind and the neighbouring countries with Kandahar and Khorasan. It also constitutes, in this direction, the boundary between the Sard Sel and Garm Sel, or the cold and hot countries (sard-sair, garm-sair cool-journey, warm-journey). The natives here affirm, that all below the pass is Hind, and that all above it is Khorasan. This distinction is in a great measure variant, not only because the pass separates very different races from each other, speaking various dialects, but that it marks the line of a complete change of climate, and natural productions.

The Bolan river is about 70 miles long, the Su-i-Bolan Pass, in lat $29^{\circ} 51'$, long $67^{\circ} 8'$ is 4,494 ft above the sea. It is

MULTAN

remarkably sinuous, but runs generally south-easterly, from a junction with the Nari River. It is liable to inundation, and as its bed, in some parts, occupies the whole breadth of the ravine, travellers are frequently overtaken by its torrents. Falls 3,751 ft in 54 m from source to Dadur — *Masson's Journeys*, Vol I p 338. See Kabul, Kandahar, Kelat.

MULTAN, the name of a district and of a town in the Punjab. The town being near the left bank of the Chenab river. Multan district bounds Bahawal-poor on the north. Multan town has had its name repeatedly changed, it is supposed to be the capital of

the Malli, of Alexander's historians, the place where Alexander was wounded. It was taken by Chach in the seventh Century, and now contains about 45,000 inhabitants. Its gardens are well stocked with fruit-trees, as mangoes, oranges, citrons, limes, &c. Its date-groves also yield much fruit, and vegetables are grown in great plenty. The inundations of the Ravi river extend to the city, but it is three miles distant, and has what is called a bandar, or boat-station, whence there is communication with the Indus, and, consequently, with the sea. The area enclosed within the walls being completely built over, the city may be supposed to contain not less than eight or nine thousand houses or from forty to forty-five thousand souls. The Multan district produces corn, oranges, palms, sugar, cotton, and indigo. Turkistan and especially the city of Bokhara, supplies Multan with silk of three kinds, namely, Lab-i-rbi, Chaikhi, and Hoshkani. These silks are purchased respectively in Bokhara from 7, 9, to 12 rupees per seer, and sold in Multan from 10, 12, to 15 rupees. One camel-load of the first kind of silk, which is equal to $6\frac{1}{2}$ mannds in weight, costs at Bokhara 440 tila, or 2,837 rupees 8 annas. Each tila makes 6 Nanakshai rupees and 6 or 7 annas. The trade of Bokhara to Multan is generally conducted by the Lohani and Shikarpuri. They load their goods on camels at Bokhara. Multan indigo, notwithstanding its impurities, is of good color, and therefore possesses the quality which constitutes the chief value of this article. Some imported from Khyi-poor was found superior to that of Multan, and valued at Rs 10 a madd more. The plant is indigenous both in Sindh and the Punjab, it is exported only to the Persian Gulf, Afghanistan and Bombay. Burton states that the people of Multan murdered Shams of Tabriz, the celebrated Mshid, or spiritual teacher, and the more celebrated Hufiz, in order to bury him in their town. The Affghan Hazara, he says, make a point of killing and burying in their own country, any stranger who is indiscreet enough to commit a miracle or show any particular sign of sanctity. Multan city was conquered by Shahab-n-din in 1171. Multan fortress, with Multaj and garrison after a prolonged siege, surrendered unconditionally to the investing Indian Army on the 22nd Jan 1849. In the time of Akbar no less than seventeen districts or separate pergunahs, were attached to the province of Multan. All that General Cunningham can identify are Uch, Dirawal, Moj and Maiot,

all to the east of the Sutlej. The old town of Uch is situated on the eastern bank of the Panjnad, 70 miles to the south-south-west of Multan, and 45 miles to the north-east of the present confluence with the Indus at Mithunkot. He thinks, also, that Uch must be the Iskandar, or Alexandria, of the Chach-namah, which was captured by Chach on his expedition against Multan.—*Richard F. Burton's Sindh*, p 357-8. *Mohun Lal's Travels*, p 392. *Masson's Journeys Vol I* p 396. *Vigne's a personal Narrative*, p 17. *Cunningham* p p 219-243. *Ancient Geog of India* p p 215, 243. MUMGO-PISIN MALLAL Gum of Moringa pterygosperrima

MUMIAI The Mumia orientalis of the ancients, mentioned by Dioscorides (in 99), was obtained from Persia, was deemed of singularly healing qualities, and hence named Saicocolla Ouseley mentions that at $1\frac{1}{2}$ mile from Khesvieh village, which belongs to the territory of Darabjeid, he sketched the Koh-i-Mumai or "Mummy Mountain," situate within three or four miles. It is an interesting locality from the mumiai or mummy, produced in its internal cavities. It is a blackish, bituminous matter which oozes from the rock, and is considered by the Persians as far more precious than gold, for healing cuts and bruises, and causing fractured bones to unite. In the vicinity of this Mumiai cavern is a village called Aym (or rather Ayi) the name of which has been compounded with mum or "wax" so as to form the word mum-i-ayi or "the wax of Ayi." The more concise account, given in Ebn Haukal's translated work (p 133) sufficiently agrees with this *History of the Manners and Customs of Ancient Greece*, Vol III, p 406. *Baron C A De Bode's Travels in Luistan and Arabistan* p 324. *Ouseley's Travels*, Vol II, p. 119. See Asphalte, Petroleum, Mumiai, Saicocolla

MUMMURTTI, the Hindu Triad, consisting of Brahma, Vishnu, and Siva or Isvara, literally three forms from mui three and mui't forms

MUMMY, the Egyptians believed in the re-occupation of the body, by the soul, and their object in preserving the body was to have it ready for the re-entry of the soul after completing its period of migrations. The mummy cases of Egypt were made of the wood of Cordia myxa

MUMTAZ MAHAL BANU BEGUM, or, more briefly, Mumtaza Begum, was the daughter of Asoph Jah, and the niece of Noor Jehan. She was twenty years married to Shah Jehan, and bore him a child almost every year. Bernier says, she was that extraordinary beauty of the East, whom the emperor loved so passionately that his conjugal fidelity was never it is said, impeached while she lived. The death of the Begum occurred on the 18th day of July 1631 occasioned by her giving birth to a daughter, who is fabulously said to have been heard crying in the womb by herself and her other daughters

MUNCHETTY MARAM

The sultana died in 2 hours after the birth of the princess. Her husband, Shah Jehan erected over her remains a magnificent tomb, known to Europeans as the Taj-Mahal, a corruption of Mumtaz Mahal. Travermer says that, in building the Taj, twenty thousand workmen were employed for twenty-two years in its erection and he states it was erected by a Frenchman of the name of Austin de Bordeaux. The brick scaffolding is said to have cost as much as the building itself. The marble had been presented by the rajah of Jeypore, and was brought from its quarries, a distance of 140 miles, upon wheeled carriages. Her husband died in A D 1666. In the middle of the apartment, underneath the great cupola, are the cenotaphs of the royal pair. They lie side by side, the empress to the left. Her name, Mumtazi Mahal Banoo Begum, and the date of her death, 1631, are read on the slab. That of her husband and the date of his death, 1666, are also inscribed upon the other tomb. *The Hind Vol I*, pp 413, 414

MUNDAH, a race occupying the eastern and southern parts of Chota Nagpore. The Mundah, Ho and Oraon are all divided into families, called Kili or Clan, and may not take to wife a girl of their own kili. Manki is the name applied to the Mundah chiefs, in the southern parts of Chota Nagpore. The Manki, of Chota Nagpore have acquired considerable estates. The Mundah and Ho houses are more isolated with better accommodation than those of the Oraon, with verandahs, and separate apartments for the married and unmarried members. Every Mundah village has its own dancing place. The Mundah comprise about two-thirds of the population of the five pergunnahs of Silli, Tamai, Barundah, Rahey and Bundu, all others being recent settlers. But many of the Mundah Kol have been dispossessed of their ancestors' lands, by middlemen, brahmins and rajputs. The Mundah settlements are chiefly in the eastern and southern parts of Chota Nagpore. The Mundah and Santal are amongst the ugliest of mankind, the Santal being remarkable for good nature and ugliness. They are more like Hottentots than Negroes.

Munda features are flat and broad. The extreme features of this race are high cheek bones, small eye orbits often with an oblique setting, flat faces, without much beard or whisker, and in colour from brown to tawny

yellow. The richer people of the Mundah, who aspire to be zemindars, wear the pota, reverence brahmins and worship kahl, but the mass continue in their original faith. The great propitiating sacrifices to the local deities are catousals, at which they eat, drink, sing, dance and make love, and the hindus settled in the province propitiate the local deities. The Mundah country is arranged into Puiha or divisions, each consisting of twelve or more villages under a chief, and the chiefs meet, at times for consultation.

Many of the Oraon and some of the Munda clans or kili, are called after animals, the eel, hawk, crow, heron, &c, and the clans do not eat the animal whose name they bear. The dead of the Moondah and Ho are placed in a coffin along with all the clothes and ornaments used, and all the money the deceased had, and all buried. The larger bones are preserved till a large monumental stone can be obtained, and the bones interred below it. The Ho near the houses, the Oraon separate from the village. They are taken to the tomb in a procession, with young girls bearing empty and partly broken pitchers, which they reverse from time to time to show that they are empty. The collection of these massive grave stones under the fine old tamarind trees is a remarkable feature in Kol villages. The stones are sometimes so large that the men of several villages are required to move them. The bones are put with some rice into a new earthen vessel, deposited into the hole prepared for them and covered with the big stone. The Munda and Oraon races are fond of field sports and all game, large and small, disappear from near them. They form great hunting parties. Fishing and cock fighting are also resorted to. The Munda and Ho have a shamanite religion. They have no worship of material idols, but Singbongu, the sun, is the supreme being, the creator and preserver, a beneficent deity, they have secondary gods, all invisible and generally malevolent, sacrifices to Singbongu are made of fowls, pigs, white goat, ram and buffalo.

The Oraon worship the sun under the name of Dhurmi, as the creator and the preserver, and offer white animals to him in sacrifice.

Mundah, Ho and Oraon are all divided into families, called kili or clan, and may not take to wife a girl of their own kili.

Manki, is the name applied to the Mundah chiefs, on the southern parts of Chota Nagpore.

Mundah and Ho houses are more isolated, with better accommodation than those of the Oraon, with verandahs and separate apartments for the married and unmarried members. Every Mundah village has its own

dancing place General Cunningham Suggests, pp 505 507 that the Munda are the ancient Munda — *Campbell*, pp 150 151 *Major Dalton*, pp 76, 94, 154, 158, 159, 160, 163, 168, 188-89, 196 *Major Dalton M. G Campbell*, p 131

MUNIA PECTORALIS One of the genus of birds called Munia See Birds

MUNICIPALITIES The Mahratta people have, amongst them, outside every village, the pariah or dher, whom they designate the Alhai, the tanner who is called Mhang, and inside the hamlets dwell the Dhor, or tanner In Hindustan and Bengal the republic or village system has been greatly disturbed by the repeated invasions and conquests of foreign races and the long period of mahomedan rule and the village officers and servants are less complete But, even there, the headman and the accountant are almost invariably retained and some of the other officers and servants are also to be found and in most instances the offices are hereditary, are capable of being mortgaged or sold are paid by recognized fees and perquisites, by allotments of grain at the time of harvest or sometimes by portions of land held rent free or at a low quit rent In the Canarese and Mahratta countries the village authorities are still ruling They greatly vary in number and in duties, but there are office holders who claim to be descendants of the persons who first settled and at dates long before the oldest of the European dynasties were established Potails in the Mahratta country trace their descent from persons who settled a thousand years ago and more in the villages they now hold and the same is to be found amongst the Reddi and Gauda of the South and East, it is this that preserves the Indian villages from the changes which would otherwise have occurred from the invasions of the Aryan, Braham, Jat, Persian, Tartar, Rajput, Arab, Moghul, Afghan, Portuguese, French and British Amongst the Mahratta, office bearers are known as Balute or Alute, amongst the Canarese, as Ayakaru, Ayagaru or Ayangaudlu The following Municipal officers may be enumerated

Head officer, styled Potal, Reddi, Gauda
 Assistant do of Changala
 Accountant, or Kalkaru
 District do of Despandi
 Chaudari, or convener of trades
 Money-changer, assayer, gold and silver-smith, or Potadar
 Barber or Nharu or Nai
 Washerman, Parit, Dhobi
 Temple servant, or Gurao
 Carpenter or Sutar
 Potter or kumbhar
 Gatekeeper or watchman, usually a pariah or Mhar, Mhang, Ramusi or Bhil, called eskar, veskar, tallar
 Waterman do do do

MUNIPORE.

Astrologer or Josi
 Shoemaker or Mhang
 Bhat or Baird
 Maulana or Mulla, a mahomedan priest.
 Coin meter
 Blacksmith
 Notary
 Sweeper
 Tailor
 Physician
 Musician

The Mahratta village head, the potail, rents the lands to cultivators, collects the Government land tax, and forwards it to the tahsildar He is also the Civil Magistrate, and settles petty civil matters to the extent of two maunds of grain, or four or six rupees and sends higher claims to the tahsildar In criminal matters he is only the police, and sends all to the Amin In lieu of pay for the above services, the potail is allowed from 25 to 50 bighas of land, rent free, the land tax being about Rupees 3 or 4 the bighah For the cultivation of his rent free lands two to four bullocks would be needed because, from 10 to 16 bighahs, according as the rains are heavy or light, are all that a pair of bullocks can get over There are generally, two or four potails in a village, not always of the same caste, for instance the village of Khanpur, zillah of Nandan has four potails, two Mahratta, a Canarese speaking lingact, and a Kulkaingah, and there are a few braham and mohamedan and pariah potails, but a Christian potail is unknown — *Wilson's Glossary*

MUNI KIRE, TAM *Premna integrifolia Rorb*

MUNIPORE, lies between the valley of Cachar and the Burmese provinces, and in the centre lie the 7000 sq miles of the Munipore territory It has the Kalanga range of 4800 feet The Muniporees are in constant dread of raids from Cachar and from Burmah The Burmese bring ponies, gold and gems from the east Its population is about 50,000, revenue in money Rs 12,000 to Rs. 15,000 Munipore, is the ancient Munpura of the Maha Bharata The country was originally peopled by a Scythic race, known as the Naga, from their worship of the snake Their conversion to hinduism was so recent as the beginning of the 18th century, but up to the middle of the 19th century, many of the Manipuri remembered the time when in most families, half of the members professed hinduism, and were called clean, and the other half followed their old Naga customs and

were called unelean Neither the language of Munipore nor those tongues of the people of the N E have any affinity with Sanscrit On the eastern frontier, the people are an entirely different race from the Kuki of the Chittagong jungles The name by which they are commonly known is 'Tipperah' In physiognomy some of them are like the Muniporee, but the greater part bear more resemblance to the Khasiah tribes having strongly marked Calmuk, or Mongolian features, with flat faces and thick lips, not in general shorter in stature than Bengali, and far more muscular and strongly made Many of them, with fair complexions scarcely darker than a swarthy European The villages contained perhaps from 100 to 200 inhabitants each, and each house is raised on bamboo piles 4 or 5 feet from the ground Up to about the year 1714 the annals of Munipore possess but little interest In that year Gareeb Nawaz succeeded to power He made several successful invasions of Burmah, but made no permanent conquest Gareeb Nawaz had three sons, named Sham Shae, Oogut Shae, and Burut Shae Oogut Shae murdered his father and his elder brother, but was expelled by Burut Shae, who reigned two years, and was succeeded by Gooioo Sham, son of Sham Shae Gooioo Sham associated with himself his brother Jai Sing, and they ruled alternately until Gooioo Sham's death, about 1764, when the sole authority fell to Jai Sing After the death of Gareeb Nawaz the Burmese invaded Munipore, and Jai Sing having sought the aid of the British, a treaty of alliance, offensive and defensive, was negotiated on 14th September 1762 On the death of Jai Sing in 1799, the country was distracted for 25 years by the efforts of the sons to succeed, but by the treaty of Yandaboo one of the sons was declared independent but there have been repeated commotions since The area of Munipore is 7,584 square miles and its population is about 75,840 The money revenue is about Rs 14,250 a year Munipore pays no tribute to the British Government, and its relations with the British Government are conducted through a Political Agent of whom the first appointment was made in 1835

Hills lie between the two British Provinces of Assam and Cachar and the north-western portion of the territory of Burmah It is an immense extent of mountainous country, inhabited by numerous mountain tribes And in this great mountain tract one or two valleys occur The largest—that of Munipore—is, from its connection with the British Government, and from the tribes around it all

admitting its supremacy, the most important It is between latitude $23^{\circ} 50'$ and $25^{\circ} 30'$ North, and longitude $93^{\circ} 10'$ and $94^{\circ} 30'$ East, the mountain tract in question is bounded on the north and west by the British Provinces of Assam and Cachar, and on the east by the Kubho valley now subject to Burmah To the north-east and south, the boundary is not well defined, and would much depend upon the extent to which the Munipore Government might spread its influence amongst the hill tribes in those directions, but in the north-east it may be denoted by a line drawn north from the north-western corner of the Kubho valley, until it strikes the Assam boundary and in the south by one drawn west from the source of the Numsailung river, the fixed south-east boundary, till its junction with the Tooyai river Of the space comprised in these bounds, the valley of Munipore occupies nearly the centre It is called by the Munipuri, "Meithailapak" The Burmese call it Kathe, the Bengalees, Moglai, and Assamese, Mekle The area of the whole territory is about 7,584 square miles, and that of the central valley about 650 Much of the valley is at all seasons covered with water It seems indeed at one time to have formed a large lake, and the piece of water in the south, called the Logtik, appears to be an unfilled but rapidly filling remnant of it From the most credible traditions, the valley appears originally to have been occupied by several tribes, the principal of which were named Koomul, Looang, Monang and Meithai, all of whom came from different directions For a time, the Koomul appear to have been the most powerful, and after its declension, the Monang tribe The population is composed of different classes The principal is the Meithai, next the Phoongnai, after whom the Teng kul, the Ayokpa, the Kei, the Loe and Mahomedan The Meithai population is divided into four parts called "Punnah" which are designated in the order of their seniority "Kaphum," "Lai phum," "Ahnloop" and "Nihaloop" The Loe population consists of people who pay tribute, and is considered so inferior that the name Meithai is not given to it The inhabitants of the hills around the valley of Munipore, in the west are known under the general appellation of Naga and Kooki In Munipore they are all embraced in the term Han, but Kumpooee, Quoneng, or Koneng, Khonraj, Kamsol, Anal-Namfau, Aimole, Kom, Cheeroo, Chote, Poooom, Muntuek, Kairum, Muring, Tangkool, Loochoopa, Mou, Muam, Miyang-khang, and Gnamai are the names in use amongst Muniporee to distinguish the

MUNJA CADAMBA.

principal tribes, and though each of these tribes has a distinctive name of its own, often quite different from the Manipore one. The Manipui and other tribes inhabiting the hills round Manipur, the Koupoor, the Mow-muram and Muring, as M'Lenan points out on the authority of M'Culloch, are each divided into four families, Koomul, Loong, Angom, and Ningthaja, a member of any of these families may marry a member of any other, but the intermarriage of members of the same family is strictly prohibited. The marshes of the south in the vicinity of the Logak afford a retreat to serpents of a formidable size, and the whole valley of Manipore is much infested by the serpent tribe. Some of them are exceedingly active and bold is the Tanglei. It is fond of ascending ladders along the branches of which it moves with great velocity, and it can throw itself from an extraordinary height upon the object of its anger. His bite is said to be mortal. Thus, added to his great activity and fierceness makes the Tanglei an object of much terror. The Manipui's dominion on the east of Bengal is noted by a Hindu rajah, in treaty with the British—*Hist. of India*, p. 121-2. *Met. Off. Records of Government of India* *Forest Department*, pp. 34-41. *Atkinson's Treatise*, &c. pp. 121-22. *Black civilization*. See Manipui, Shiv.

MUNI, in the Hindu religion, a sage, ancient, holy, or learned man, styled also Rishi, or *Shrotrava* deeds and the sacred books prescribed. The succession or dying up of the *Shloka* of Krishnan and of the Nepalvalley is ascribed to two Muni. See *Brahmistic Descriptions*, p. 389. *Lords of Created Beings*, Hindu.

MUNI KARKUTSANDA. See Buddha.

MUNI, Hind. *Saccharum sira*, and *S. munga* also *Eleocharis comosum*, very useful grass, very common in many parts of North India, and known under several names. Two inch ropes, often 50 fathoms in length, made of Munja fibres are sufficient for dragging men, largest or 1,200 man and boats up the Indus, against the full force of the stream. The rope is also light, so advantageous for rigging, and bears without injury, alternate exposure to wet and to subsequent drying, both qualities being essential for a tow-rope. The upper leaves, about a foot or so in length, are preferred, they are collected into bundles and kept for use—*Rap. Ind. Edes*, p. 39. See Cordage, Grasses. Rope, *Saccharum*.

MUNRIVEE, HIND Eleusine coracana
Great Rowl

MUNRO Sir Thomas, G C B, a
Madras infantry officer, who rose to the
rank of Major-General. He was Collector
of the Ceded Districts, of the Bara Mahal,
and as Commander of a division of the
Madras Army in the third Mahratta War, he
took Sholapoor and settled the whole of the
country between the Ceded Districts and
the Southern Mahratta country. He was
afterwards Governor of Madras and died of
cholera near Ghooty in 1827 aged 65. He was
an able administrator and a statue by Chantrey
in which he is seated on a horse in still life,
has been erected in Madras to his memory.
An inscription to his memory says near this
stone are deposited the remains of Major-
General Sir Thomas Munro, Bart K C B, Go-
vernor of the Presidency of Fort Saint George,
who after forty-seven years of distinguished
Civil and Military services, seven of which
he passed at the head of that Government
under which he first served as a cadet, was
suddenly called from his labours on the 6th
of July 1827, at a moment when in the
language of the Honorable Court of Direc-
tors "he was on the point of returning to
his native land in the enjoyment of well
earned honours from his sovereign and from
the Company, having recently manifested a
new proof of his zeal and devotion in re-
taining charge of the Government of Madras
after he had intimated his wish to retire there-
from, rendered the discharge of the duties
of that high and honorable station peculiarly
arduous and important. *Æt 65*" Sir Thomas
Munro was from the earliest period of his
career remarkable amongst other men.
All those who were associated with him
at the commencement of his service,
many of whom have since become illus-
trious in the annals of India and of
their country, yielded to him with com-
mon consent that pre-eminence which be-
longed to the ascendancy of his charac-
ter. The resources of his mind rose

superior to every emergency of Civil Govern-
ment or Military enterprise, and he united to
these great qualities an unpretending modes-
ty (that exalted sign of innate worth)
which counted no applause, and which would
have obstructed his advancement had not
his transcendent merits in the cabinet and
in the field forced him into public notice and
elevated him to the highest office of this
Presidency. Another monument says 'Major
General Sir Thomas Munro Bart and
K C B, Governor of Madras, died at Putte-
condah on the 6th of July 1827, and was
interred at Gooty, where the Court of Direc-
tors have erected a monument to his me-
mory. His remains were afterwards removed
to the seat of Government, and his widow
has raised this stone to mark the spot where
they are deposited.' The successful march
which he made westwards to Sholapoor, in
the third Mahratta war, indicated the high-
est administrative and military ability and
his connection with the ryotwar revenue
system in use in Madras was of great value
to the country. He was a principal agent in
arranging the land settlement of the Madras
presidency, which still prevails.

Under British rule the three land
tenures are known, as the *zemindari* or per-
manent settlement made in 1792 by Lord
Cornwallis, of Bengal proper, and since
then extended to Behar and Orissa, in which
the lands are divided amongst middlemen,
who pay a quit-rent to Government, which
in Bengal has been definitely settled and
something similar to this has been proposed
for Oudh as the *Talukdani*.

Under the Ryotwar tenure in Madras,
recognized by Sir T. Munro, the cultiva-
tors are the owners of the soil and pay
direct to Government. A modification of
this has been introduced into Bombay.

The *Pattadani* tenure was established by
Mr R. Martin Bnd in the North West
Provinces, and it has since been extended to
the Punjab. In this, Government deal direct
with village communities who are jointly
responsible for the assessment.

In Bombay and Madras, Government
transacts its revenue business, direct with
the cultivating ryot or farmer, who is re-
garded as the tenant or proprietor paying a
ten duty, and so long as that is paid he
cannot be dispossessed, neither in Bombay
nor Madras, is there any middleman. In
Bengal, however, the British took up the
zemindari system, who under mahomedan
rule, had been partly a rent collector and
partly a landed proprietor, and elected him
to be owner to the exclusion in many cases
of the rights of the cultivators. Subsequent-

ly, the Government, to the exclusion of the real owner elected the tenant of the village community. In Bengal and Oudh, the land tax is still levied on estates in northern India on villages and proprietary holdings, and on individual fields. But in Madras, and Bombay, the tax is levied on the blocks of 10 or 12 acres according to the convenience of the occupiers.

MUNSOOR ALI KHAN. An almost direct road from Humayoon's tomb near Delhi leads to a mausoleum of nawab Munoor Ali Khan, Suflim Jung, one of the mums of Delhi. Before the accession of the British dominion, he and his ancestors it is said, held the Soobildance of Oudh. This native nobleman's remains were entombed here on the building answers the purpose of a cenotaph. It is a substantial work of red stone so common in many of the edifices of Delhi. It is in many parts relieved with marble, is surmounted by a huge white marble dome, forms a structure of some magnitude and is said to have been erected about A D 1690. The tomb stone on the upper floor and on a line with the sarcophagus is a choicest piece of sculpture of white marble, and the leaves which surround its base form an excellent and most specimen of the power of the chisel in the hands of art. The mausoleum is situated in the centre of a large area of enclosed ground laid out into a fine garden and occupies an isolated position on the main road which connects Delhi with the Kootub—*Tour in India by French*, p 13.

Cashew-nut oil, Munta mamidi vittu; the Cashew Nut.

MUNTA MANDU, TEL *Desmodium triflorum*, *D C W* and *A*—*Hedysarum trif* R m 353, H reptans 354.

MUNTJAK of the Sundanese, Kidang of the Javanese and Kyang of the Malays of Sumatra is found in Banka, Borneo, Java and Sumatra, is the *Cervulus vaginalis* of Boddart and Gray and the *Cervus muntjak* of Zimmerman.

MUNTJACUS VAGINALIS, Gray syn, of *Styloceros muntjak*—*H Smath*.

MUNTOPUM, small open hindoo temples standing near the larger ones, into which the figures of the deities, are placed on being brought from the latter, on days of festivals, for worship—*Cole Myth Hind* p 390.

MUNTRA, SANS in hindooism, a prayer, an invocation, a charm. Mantia is a Sanscrit word derived from matr, to repeat in the mind. The great muntia of the brahminical hindoos is styled the Gaeti, and is deemed the holiest verse of the Vedas, it is an invocation to the sun. There are six descriptions of charms, or mantras known in Goozerat, which are described in a series of works forming the Scriptures on the subject, or the Muntia Shastria. A charm called Mainn Muntia has the power of taking away life, Mohun Muntia produces ocular or auricular illusions, Sthumbhun Muntia stops what is in motion, Akushun Muntia calls or makes present anything, Wusheckurun Muntia has the power of enthralling, and Oochatun Muntia of causing bodily injury short of death—*Rasmala, Hindoo Annals, Vol II* p 403. See Gaeti, Hindu.

MUNTRA DROOMA, SANS from manan to meditate and dooma, a tiec.

MUNTYLUM, TAN Petroleum naphtha, literally Earth oil.

MUNUDUA MUDDU, TEL *Desmodium triflorum*.

MUNUGU TAMARA, or Mudugu TEL *Marsilia quadrifolia*, L Byoron munugu, meaning submerged, and tamara, an aquatic plant generally.

MUNUSA, SANS from manas, mind.

MUNASA a hindoo goddess, the queen of the snakes, or she who protects men from their fatal bite. The lower orders crowd to the three annual festivals held in honour of this goddess.

MUNUSIJA, SANS from munu, mind and jann, birth.

MUNWAR PIALA, amongst the Rajput races, a favourite expression, and a mode of indicating great friendship, "to eat off the same platter (thali), and drink of the same cup

MURÆNIDÆ

(pala) " (Tod's Rajasthan Vol I p 183) relates how a rajput pledged another's health and forgiveness in the munwai pala, on which they made merry, and in the eup agreed to extinguish the remembrance of the feud

MURGHAB The valley of the Mughab
 is traversed in its whole extent by a river
 which bears its name It takes its rise in
 the Bulverdi, or, perhaps, even the Audekan
 hills It is the same which in Sir Robert
 Keir Porter's "Travels in Persia," &c, is
 called the Kur-ab, and is the Medus of the an-
 cients After it assumes the name of Polvar,
 passing close to the ruined city of Istikh,
 it enters the plain of Meidasht, having the
 Husein-Koh, with the sculptures of Naksh-i-
 Rostam to the right, and the Koh-i-Rahm
 with the bis-ichels of Naksh-i-Reheb,
 and the ruins of Takht-i-Jamshid, to the
 left. The Polvar runs in a southwesterly
 direction across the plain, and joins the

MURIATE OF AMMONIA

Kum-Funz (ancient Alaxes) near the bridge of Pul-i-Khan, serving in its latter course as a line of demarcation between the districts of Merdashit to its left, and Hafiek to the right. Across the river is the dam or Bandamun (Bendamun) built by Amir Azan Dilem — *Baron C. A. De Bode's Travels in Lunistan and Arabistan* p 75 Ferrier

MURGHAB To the north of Herat and Kabul is a range of undulating country, which in some places assumes a mountainous, in others a hilly character, and in some parts, is well watered, in others bleak and rough, forming a water shed of two natural divisions, from the west of which flows the Murghab, the Tejend and the Furiah-Rud, and from the east, the Helmund, the south eastern feeders of the Oxus and the north western feeders of the Kabul river. The hilly, mountainous, country is occupied by the Aimak or Chai Aimak and the Hazara. The Murghab rises in the Hazarah hills, north of the continuation of the Hindoo Koosh ridge and south of Mymna and, running west 70 miles, turns northwards, and quitting the hills passes through a desert country, for about 200 miles to join the Oxus three marches west of Bokhara. In the cold season its breadth is 270 miles and it is $2\frac{1}{2}$ feet deep

This salt is met with in every Indian bazaar. It is obtained in Egypt and SE Asia from the unbaked extremity of brick kilns in which manure of camels' dung has been used as fuel. It is manufactured largely in the Kurnal district, by the potters or kumhar of the Kathal and Gula tahsil by submitting refuse matter to sublimation in closed vessels. From 15,000 to 20,000 bricks made of dirty clay are put around a brick kiln and when the kiln is fired, crude muriate of ammonia exudes from the dirty bricks in two forms, the inferior kind, called kham mitti, is 20 to 30 maunds and sells at eight annas the maund, the better kind, called papri, does not exceed one or two maunds and sells at Rs 2 or Rs 2½ the maund. The Kham mitti is purified by

MURID

sifing and repeated solution and crystallization up to the fourth time. It is then boiled for nine hours and the resulting salt resembles the raw. The better kind is then sifted, mixed with, and the product put into a large pear shaped glass vessel with a brick $2\frac{1}{2}$ feet long and 3 inches in diameter and mouth closed. In China, it is obtained in Lan-chan-fu and Ning-hua in Kan-Su. The volcanic mountain of Peh-ting in Tsin-fan is said to yield an ammoniated salt. It is used in the arts, as a flux or solder and also in medicine. *Powell Hand Book* pp. 89-90 *Smith Mat Med Waring Manual of Therapeutics*

MURIATE OF SODA Salt, common salt, or chloride of sodium, is obtained from sea-water by evaporation, also occurs native and is likewise obtained from saline soils. Mineral salt, of very fair quality is obtained in Mysore, Bellary and Hyderabad, is known to occur also in the Guntoor and Nellore Districts, and to be almost invariably accompanied by gypsum, magnesian limestone, sandstone, sulphur, red and brown iron ores, and alum slate. MURID, AR Amongst mahomedans a dis-

ciple, a pupil, particularly a pupil of a murshad or head of a sect of the dāवेश. Amongst those who crave for other aids to salvation, some seek the spiritual advice of a holy man, who is reckoned a pu, or religious teacher, and by certain secret words and signs are initiated as his murid or disciples. Others, even men of rank, adopt the dāवेश or fakī life of the religious mendicant devotee, often attended with solemn rights of investiture, and followed by the severest of ascetic rites, but the bulk of these mendicants are, in India, idle, dissipated men, and a few are of very degraded manners. They arrange themselves into the followers of certain pu or spiritual guides, and those met with in India are the Kadīa or Banawa, Chastīa, Shutāia, Tabqatīa or Madāia, Mallang, Rafai or Guiz-mai, Jalāia, Sohāgia, Naksh-bandīa and Bawa Puay. All these have their own rules and customs, some of them are ascetic devotees, eating if given to eat, but never begging, some largely use intoxicating fluids and vegetable substances, some, as the Salik have wives, the Majzub and Azad have no wives, and some of the Calandais marry and some do not.

MURIDÆ, the rat tribe of mammals of the order rodentia or gnawing animals. The family includes the Jerboa, the Dipodidæ or Jerboidæ of authors, the tribe may be thus shown,

In a memoir on the rats and the mice of India, by Mr. Edward Blyth, he says, the Gerbilles are a group of burrowing field rats common (as a genus) to Asia and Africa, of gracile form, with small fore-limbs and inversely developed hind-limbs, a longish furnished tail, the hairs of which are gradually lengthened towards the extremity into a kind of tuft, and with distinctly grooved upper rodentia tusks. There appears to be one Indian species only, and one in Afghanistan. He enumerates the Muridæ as under

Gerbillus Indicus, Blyth

Dipus indicus, Hardwicke, F. Cur Waterhouse

G. Hardwickei, Gray
Meriones apiculatus? Kuhl

Mus jencus, B Ham

Mus jenkinsi, B. Hant
Desert rat of Cabul, Elphinstone, MSS

Gerbillus erythronra, Gray, Afghanistan.

Dr Gray says *Alactaga indica* inhabits Candahar, and Quetta and *Lagomys rufescens*, India and Cabul, but Mr Blyth doubts this, and regards them as animals needing a temperate climate

Nesokia Indica, Btyth

Mus indicus Geoffroy, *Desmarest*, *Lesson*, *Brandts*,
Schinz

Schinz
Arvicola indica, Gray, Hardwick
Mus providens, Elliot

Mus providens, Elliot
Neotoma providens

This is the common shortish-tailed field rat of all India, and Ceylon, varying somewhat in shade of hue according to the colour of the soil on which it dwells

Mus bandicota, *Bechstein*

Bandicota rat, Pennant
M. giganteus, Hardwicke, Elliot

M. giganteus, Ha
M. perchal. Shaw

M malibaneus, Pennant, Shaw

M 1511a, B Ham

Neotoma nemorivagus, Hodgson
Neotoma giganteus, Elliot

The pindi-koku, or pig-rat, inhabits all the peninsula of India

Mus setifer, Horsfield

M. giganteus, Linn

Allied to the *M. Brudicota*, but clearly distinct as a species. Inhabits Sumatra Java, Borneo and Penang. "The larger of two individuals, captured in gardens, measured—head and body $10\frac{1}{8}$ inch, tail $7\frac{1}{2}$ inches (*Cantor*). In his *B. Mus Catal. Di. Gray* mentions a 'black variety,' and a 'brownish variety with face brown' from Tasmania

Mus rufescens, Gray

M. flavescens, Elliot

M. musculus, *Cantor*

Inhabits Penang

Mus decumanus, Pallas, *Gluc.*, 91, *Buffon*, H N viii t. 27

M. javanus, Pallas apud Schinz

M. norvegicus, *Buffon*

To this species *Di. Gray* refers (with a mark of doubt), in his Catalogue of *M. Hodgson's* collection, the *M. decumanoides* *Hodgson*, (nec *Waterhouse*, nec *Horsfield*), which does not appear to have been described, also *M. brunneus*, *Hodgson's Ann. Mag. N. H.* xv (1845) 267

Mus decumanoides, *Temminck* (nec *Hodgson*), is given in *Di. Horsfield's Catalogue* of the Mammalia in the Indian House Museum—two specimens, from Bengal, presented by Gen. T. Hardwicke perhaps *M. nemoralis*, *Blyth*?

Mus rattus, L. (*Buffon*, H N vii 278, t. 36) The European black rat comes from vessels into the ports of Calcutta, it differs in no respect from others received from France. Mr. Elliot in his Catalogue of Mammalia in the Southern Mahatta country notes it as "rare" and Mr. Layard includes it from Ceylon, where *Di. Kelaart* obtained one individual in a house, in Trincomali, remarking that he had not seen it from any other part of the island

Mus rattoides, the black rat of Nepaul, is similar to the black rat of Europe

Mus brunneusculus, the brown rat of Nepaul, is similar to the brown rat of Europe

Mus Andamanensis, *Blyth*, J A S xxix 103

M. nicobaricus? *Schrezer*, Zoology of Novara Expedition

The indigenous rat of the Andaman Islands. Length about 8 inches, tail the same, ears much as in *M. decumanus*

M. nemoralis, *Blyth*, J A, S B xv 168 resembles *M. rufescens*, except in being considerably larger, much less rufescent above,

and the under parts are merely paler or dull greyish brown, occasionally somewhat albescent. Length about $8\frac{1}{2}$ inches tail $9\frac{1}{2}$ inches hind-foot $1\frac{1}{2}$ inch

Mus niviventer, *Hodgson*, J A S v 234, *Ann. Mag. N. H.* xv, (1845) p. 267, a house rat. Proportions and characters of the last (*rattoides*), but tail rather shorter, and long piles of the pelage rarer

Mus robustulus, *Blyth*, J A S xxviii 291 *M. infescens*, Gray? var? *Blyth* *M. rufescens*, auct. of Borneo and Penang *M. rattus* brown var., apud *Blyth*, J A S xvii 559? perhaps also *B. Beidmorei*, nobis, J A S xx 173

Mus rufescens, Gray, *M. N. H. N. S. I.* (1837) p. 585, apud Gray

M. flavescens, Elliot | *M. rufus*, Elliot

M. alboreus, B. Ham. *Horsfield's Catalogue*

M. montanus, Kell | *M. kandianus*, Ell

Tetragonurus, *Kelaart*, J A S xi 169-185 figured by the name of *M. alboreus* in one of B. Hamilton's unpublished coloured drawings (Vide J A S ix 168)

Mus palmarum, *Schreier*, from the Nicobar Islands, probably belongs to this group

M. cinnamomeus, *Blyth*, J A S xxviii 294 "Like *M. flavescens*, but smaller, with proportionally longer tail and softer fur of a fine bright cinnamon colour, with inconspicuous black tips, the under-parts white, which is abruptly divided from the cinnamon hue above

M. Beidmorei is thus described—Length about a foot, of which the tail is not quite half. Ears posteriorly $\frac{3}{4}$ inch. Hind-foot $1\frac{3}{4}$ inch. Fur shortish, even, coarse and hispid, but not spinous, of one quality, with no long hairs intermixed. Its colour grizzled grey (dull brown) above unmixed with rufous below and on the feet, white.

Mus nitidus, *Hodgson*, *Ann. Mag. N. H.* xv (1845) p. 267 "Distinguished for its smooth coat or pelage, wherein the long hairy piles are almost wanting. It is a house rat, like *M. niviventer*, but much rarer, and frequents the mountains rather than the valleys

Mus horiotes, *Hodgson*, *Ann. Mag. N. H.* xv (1845) 268 Dwells in houses and out-houses. A small land species with fine pelage, and no peculiarity of physiognomy or proportion

Mus fulvescens, Gray, *Catalogue of M. Hodgson's Specimens*, p. 18 "Fur pale fulvous, hair very soft lead coloured, with

bright yellow tips, and interspersed with slender black bristles, throat, belly, and beneath, pure white, tail elongate-nearly bald, cutting teeth, narrow skull about 1 inch, 2 line, hind-feet about 1 inch

Mus æquicaudatus, *Hodgson*, described in *Horsfield's Catalogue*, p 141 "Pure dark brown above, with a very slight rufescent cast in a certain aspect, underneath from the chin to the vent with interior of the thighs, yellowish-white

Mus concolor, *Blyth*, J A S xxviii 295 (the young), and *M* (unnamed), p 294 *ibid* (the adult) Common small thatch rat of Pegu and Tenasserim provinces

Mus oleraceus, *Bennett*, P Z S 183, 2 p 121

M oleraceus et (olim) *longicaudatus*, *Elliot*

M dumeticolæ, *Hodgson*, and the young?

M povens H, *Ann Mag N H* xv (1845) 268 2

M dumecolus, *Hodgson* (undescribed)

Mus badius, *Blyth*, J A S xxviii 295 Like *M oleraceus*, but the eye fully twice as large and black whiskers, colour of the upper parts a more rufous chesnut or cinnamon hue, of the lower parts white, almost pure

Mus glinoides, *Blyth*, J A S xxiv 721 "This has very much the aspect of the British dormouse (*Myoxus avellanarius*), but the colouring is much less bright, though inclining to the same hue

Mus peguensis, *Blyth*, J A S xxviii 295 A field mouse with tail longer than the head and body, well clad with hairs that become longer to the end

The series next following consists chiefly or wholly of house mice

Mus urbanus, *Hodgson*, *Ann Mag N H* xv (1845), p 969

M dubius? H, *ibid* p 268

M musculus, apud *Elliot* et *Kelaart*

M mami, *Gray*, (undescribed)

Mus homomys, *Hodgson*, *Ann Mag N H*, xv 1845, p 268

M Nipalensis, H J A S x 115 (undescribed,)

The common house mouse of the Himalaya hill-stations, from the Punjab to Darjiling

Mus crassipes, *Blyth*, J A S xxviii 295 Like the preceding, but with the tail rather longer than the head and body

Mus Tytleri, *Blyth*, J A S xxviii 296 "Length $2\frac{3}{4}$ inch, tail the same (having about 24 vertebrae)

Mus Bactrianus, *Blyth*, J A S xv 140 Presents a very close approximation to *M*

musculus in size, proportions and structure, inclusive of the conformation of the skull, but the fur is much denser and longer, and its colouring absolutely resembles that of a pale specimen of *Gebillus indicus*, except that there is no whitish about the eyes, nor is the crown of a deeper hue, and the tail is thinly clad with short pale hairs to the end

M gebillinus Entire length of male 5 inches of which the tail is $2\frac{2}{3}$ inches, hind-foot $\frac{3}{4}$ inch car-conch barely $\frac{1}{4}$ inch Female rather smaller

Mus Theobaldii like *M gebillinus* (*Bartmann*) but larger with comparatively shorter tail and larger feet

M nitidulus, *Blyth*, J A S xxviii 291, House mouse apparently, with tail equal to the head and body, and uniformly furnished with minute setae to the end, ears large and ample It is the house mouse of Shway Gheen on the Sitang, colour like *M Decumanus*

Mus cunicularis, *Blyth*, J A S xxiv 721 A small field mouse remarkable for its ample ears, and tail shorter than the head and body

Mus Daijcelengensis, *Hodgson*, dusky brown above

Mus erythrotis, *Blyth*, J A S xxiv 721 A very different form of mouse from *M glinoides*, and equally different from the common house mouse

Mus infimalincatus, *Elliot* M S

M Ellioti, *Gray*, (undescribed)

nec *Golunda Ellioti*, *Gray*, B. *Mus Catal Mamm* p 110

The largest of the group

Mus cervicolar, *Hodgson*, *Ann Mag N H* xv (1845), p 268

M albidiventris, *Blyth*, J A S xxi 351

Distinguished by its short tail

Mus fulvidiventris, *Blyth*, J A S xxi 351

M cervicolar? *Hodgson*, apud *Kelaart*, *Pied Faunæ Ceyl*, p 63

Length about $2\frac{1}{4}$ inches, tail (vertebrae) $2\frac{1}{2}$, tarsi to tip of claws $\frac{5}{8}$ inch

Mus strophurus, *Hodgson*, *Ann Mag N H* xv, (1845) p 268 A field mouse closely allied to *M cervicolar*, but seemingly distinct

Mus tenuicolar, *Blyth*, J A S xv 172 This much resembles *M lepidus*, *Elliot*, in form and colour, but the face is very much shorter and the fur short, soft, and not spinous in the least degree

Leggada spinulosa, *Blyth*, J A S xiii, 734 Nearly affined to *M platythrix*, *Syles*, but of a dark dusky colour above, with fulvous tips to the softer fur, below and all the feet dull whitish

Leggada jerdoni, *Bl*, n s Bright, dark ferruginous above, pure white below, some fine long black tips intermingled among the spines of the back, limbs marked with blackish externally, the feet white

Leggada platythrix

Mus platythrix, *Bennett*, P Z S. 1832, p 121
M saricola, *Elliot*, M S S

Light sandy brown, white beneath, the flat spines less developed than in the two preceding species

Leggada lepidus

Mus lepidus, *Elliot*, Madr Journ L Sc x 216
L hooduga, *Gray*, M N H J, 1837 p 586

Similar to the last but smaller, and but weakly spinous

Golunda Ellioti, *Gray*, M N H 2nd series, 1 (1837), p 586

neo *Mus Ellioti*, *Gray*, Br Mus Cat

Fur pale brown, with minute, very slender, hair-pointed black tips Chin, throat, and beneath whitish

Golunda coffæus

Mus coffæus, *Kelaart*, Prodomus 1852, p 67

Head and body $4\frac{1}{2}$ inch, tail 4 inches This rat in Ceylon is destructive to coffee trees Whole plantations are sometimes deprived of buds and blossoms by these rats

Golunda miltada, *Gray*, M N H 2nd series, 1, (1837), p 586 Length of body and head $4\frac{1}{2}$ inches Fur very soft, mouse-coloured varied with black, chin, and beneath, whitish

Golunda newera, *Kelaart*, Ann M N H 2nd series viii (1851), p 339 Length of body and head $3\frac{1}{2}$ in tail $2\frac{1}{2}$ inches Fur soft, yellowish-brown varied with black, chin and beneath yellowish-grey, under-fur dark lead colour, soft long hairs on the upper parts of the head and body, with long black-tipped hairs having a subterminal yellowish band, fur of belly dark lead-colour, tipped with yellowish-grey

Hapalomys longicaudatus, *Bl*, loc cit Received from Schwe Gyne on the Sitang river

The above is an epitome of the long and perplexing series of Indian Muridæ, so far as the published descriptions of them can help to identify any species under observation

Dr Kelaart's *Mus arboreus*, *Buch Ham* is *M nemoralis*, *Blyth*, p 168 *M Indicus*

Geoffroy, apud *Blyth* M Tetragonurus, *Kelaart*, M Blyth takes to be *M rufescens*, *Gray*, M musculus apud *Kelaart*, to be *M mani*, and *M Asiaticus*, *Gray*, apud *Kelaart*, (Paddy-field rat,) is undescribed — *M Blyth in Beng As Soc* 1861, Journ v 32, p 327-353

Mus araneus, *Mygale* or shrew mouse, amongst the Egyptians was, according to Bunsen, sacred to Buto or Mut, and was worshipped in Attubis

Mus ceylonicus, *Kelaart*, a rat found only in the Ceylon cinnamon gardens

Mus bandicota, *Bechst*, the Bandicoot rat is a favourite article of food with the coolie labourers who visit Ceylon, it attains on the Ceylon hills the weight of two or three pounds, and grows nearly to the length of 2 feet It feeds on grain and roots, its flesh is said to be delicate, and much resembling young pork The sides of the hills of near Yank-ackh, kundur were found by Moorcroft plentifully peopled by the bushy-tailed rat, the *Mus hamster* of Pallas A large spotted lizard was also frequent, burrowing in holes in the ground — *Moorcroft's Travels*, vol ii p 417 *Tennent's Sketches of the Natural History of Ceylon*, p 41

MURLAH, a township in Mewar, inhabited by a community of Chaurans

MURLE, TAM ? *Sansevieria zeylanica*

MURLI, several of the Indian races, the

MURLI

Dhangan, Dher or Parth, Mang or Chakali, Koli and Minuwua and occasionally, even the higher hindoo castes, under various vows, devote their girls to their gods. The deity to whom the girl is more frequently vowed, is some incarnation of Siva and his consorts. Amongst the Malhatta people on the western side of India, Krodoba, is the usual Siva avatar, to whom the girls are devoted and his chief shrines are at Jejuri, Khanapur near Bader and at Milligaon. The ordinary people believe that from time to time, the shadow of the god comes on the devotee (*deo ki chaya atri ang pu*)—and possesses the devotee's person (*Murh ki ang ko bhari deti*). These devotees are called *Murh* in Malhatta, *Jegm* or *Jogmdam* in Canarese and *Beswa* in Telugu. They, at times, expect to be possessed, during which they rock the body, and people occasionally make offerings to them as to an oracle or soothsayer lying money at their feet, and wait till the possessing to hear a decision enunciated. The female deity to whom those near the Baner river are devoted is Yellamah, the Bhon-koh rice devote their *Murh* to Mata, Boys also are devoted, and styled *Waghar*, from *Wag* "a tiger". Near Oomrath it is to Anba and to Kandoba that the *Murh* and the *Waghar* are devoted. The *Waghar* does not associate with the *Murh*. At Oomrath, the people say that Kandoba particularly moves on Sunday and selects a elm tree (*clm Murh*) whose body he fills. This idea of the visits of the gods pervades hindu society, it is not the belief that their visits are restricted to these devoted women but that all women are liable to be selected by the deity, the visitor assuming the appearance of the husband. A comely hindu woman is married but without offspring, is supposed to be the subject of such supernatural visitation. So, of old, when Demaratus, says Herodotus, had spoken, to his mother "the mother considered him in this manner—"Son, because you so earnestly desire me to speak the truth, I shall conceal nothing from you. The third night after Ariston had conducted me home to his house, a phantom, entirely like him in shape, entered my chamber, and having lain with me, put a crown on my head, and went out again." Similarly in the *Bacchae* of Euripides, the hero says

"For that the sisters of my mother (least
"Becomes it them) declared that not from Jove,
"I sprung, but pregnant by some mortal's love
"That Semelos on Jove had falsely charged
"Her fault, the poor device of Cadmus."

In British History Merlin, and Arthur himself, were both the sons of Bhoots, (*Vide* Geoffrey's History, Book vi, Chap. xiv,

MURRAIN

and Book viii, Chap. xix,) to the former of which cases Spenser thus alludes—

"And sooth the men say that he was not the sonne
"Of mortal sune or other living wighte,
"But wondrously begotten and begonne,
"By false illusion of a ghaileful spite
"On a faire ladye nun."

In Scotland the story of the Lady of Drummelzier and the Spirit of the Tweed is related in Note M, Lay of the Last Minstrel. In India, the cases of Sheeladitya, of Usa and Annud, and of Kamala Kuuwen are similar and Captain Westmacott relates another in an Article on Chaidwai in Assam, in the Journal Bengal Asiatic Society, IV 187, *et seq*. Butler thus satirically alludes to these stories—

"Not as the ancient heroes did,
"Who, that their wise births might be hid,
"(Knowing that they were of doubtful gender,
"And that they came in it a windoic)
"Made Jupiter himself, and others,
"O th' gods gillants to their own mothers,
"To get on them a race of champions,
"Of which old Homer first made lampoons)"

But this satirist's scornful remarks however applicable to a civilized people, are not so to races like those of India, whose belief in spirits is their chief cult—*Hudibras*, Part 1 Canto ii v 211-8 *Ras Malu Hindoo Annals*, vol ii p 379-80 See Jejuri Kandeh Rao Krishna.

MURLIDAR or the Tuncfal, a name of Krishna, represented playing on his flute

MURMAR, Guz Hind Marble

MURMARI, a village, ten miles from Bandana, the villagers worship at the tomb of an English lady. Similarly, at Assaye, the villagers worship at the grave of an artillery officer who was killed during the battle.

MURMI, a buddhist tribe bordering between Nepal and Sikkim,

MUROOR, Beng Eleusine cornina

MUROODOO, Tam a small tree of Palghat, wood of a light colour, used for buildings—*Col Frith*

MUROOGANA TALLOW, ANGLO-MAL See Oil

MURTOO, Sans from mice, to kill

MURO-POLYNESIA See India

MURR Arab Myrrh

MURRA, Hind Cyananthus Sp

MURRAIN, from their constant exposure at all seasons, the cattle of the E Indies both those employed in agriculture and those on the roads, are subject to devastating murrains, that sweep them away by thousands. So frequent is the recurrence of these calamities and so extended their ravages, that they reduce the facilities of agriculture at critical periods of harvest. A similar disorder, probably peripneumonia, frequently

carries off the cattle in Assam and other hill countries on the continent of India, and there, as in Ceylon, the inflammatory symptoms in the lungs and throat, and the internal derangement and external eruptive appearances, seem to indicate that the disease is a feverish influenza, attributable to neglect and exposure in a moist and variable climate, and that its prevention might be hoped for, and the cattle preserved by the simple expedient of more humane and considerate treatment, especially by affording them cover at night—*Tennent's Sketches of the Natural History of Ceylon*, pp 50, 51

MURRAVETTY, TAM *Hydnocarpus mebrans*

MURRAYA, a genus of plants, the Minkay tree in Tavoy, a species of *Muraya* has a tough close grained wood used for handles. It is not a large tree, but is highly esteemed for handles to spears, knives, &c The grain is like boxwood, but tough and elastic. Found only in the lower Burmese provinces. The Ash leaved *Muraya*, the *Ettenya*, of the SINGU is a timber tree of the eastern province of Ceylon, a cubic foot of the wood weighs lbs 60 and it is said in last from 10 to 70 years. It is used for handles of mamoties, hammers and bill-hooks and as rafters for cidjan roofs. The Krien sometimes furnished Mr Mason with specimens of wood a species of *Muraya* scarcely to be distinguished from the box-wood of Europe. Dr Wallich found *Nancea cordifolia* on the banks of the Irrawaddy, which has "wood coloured like that of the box tree, but much lighter, and at the same time very close grained." It may possibly be the same tree, also the Tenasserim wood is not light, or it may be a Tavoy tree, which he says has "a strong tough wood, in grain like box"—*Dr Wallich Malcom's Travels in South-Eastern Asia*, vol 1 p 190 *Dr Mason's Tenasserim Mr Mendis*

This is a small but most beautiful shrub of the East Indies and China. The fragrance of its delicate white flowers is delightful and has procured for it the name of the honey bush. *Muraya exotica*, *M. paniculata* and the *Aglais odorata* are cultivated in China as very fragrant shrubs. A variety grows in Ceylon in gardens only, another variety being common in the warmer parts of the island and up to an elevation of 3,000 feet. In the Dekkan, it is an ornamental shrub,

with beautiful dark green leaves, flowers white, and fragrant in the evening, is to be found in most gardens, and is easily grown by layers or cuttings. Dr Hooker found the woods of the Rajabat, in the Soane valley full of monkeys, and amongst other plants, observed *Muraya exotica*, but it was scarce—*Hooker's Himal Jour* vol 1 p, 44 *Ainslie's Mat Med* p 162 *Thunb En pl Zeyl* Dr Williams' *Middle Kingdom* Dr Riddell Mr Thomson

MURRAYA KENIGII, Spring syn of *Berberis komugi*, *Linn*

MURRAYA PANICULATA The Cosmetic bark tree, indigenous in Burmah above Rangoon. A small ornamental, fragrant, flowering shrub with pinnate leaves, flowers white and fragrant, appear in December and January, fruit reddish. Its fragrant bark is more universally used for a cosmetic than sandal wood—*Riddell Mason*

MURREE, a sanatorium, situated on the summit of a ridge at the western extremity of the Himalay, overhanging the plateau of Rawil Pindi, from which it is 19 miles distant. Its position is 31° N lat, 73° E long and its elevation above the sea level is about 7,300 feet. On the southern slope the vegetation presents the ordinary features of the Western Himalaya, but in a paucity of forms. The general appearance of the station is very striking, though the back ground is less grand than that of Massuri, Simla, Dharmasala or Dalhousie, yet the varied positions of more than a hundred residences on different heights and acclivities, many of them hid in forest verdure, others on naked points of rock form a picturesque landscape. The forests clothing these hills are composed chiefly of 1 species of pine—the deodar or dhuni, *Cedrus deodara*, is found on Mount Mochpina, extending from 7,000 feet to its summit. It grows on the precipitous limestone cliffs, but is not abundant. It is not seen on the Murree range or outer hills towards the Jelam. The "chil," *Pinus longifolia*, covers the lower hills from 2,000 up to 6,000 feet. It grows to a large size and yields a valuable timber, which is strong and durable so long as it retains its resin. This tree abounds, particularly on the northern slopes. The "hai," *Pinus excelsa*, seldom grows below 6,300 and ranges up to 9,000 feet. It resembles the chil, but is of a darker green color, with shorter and finer triangular leaves, having five in a fascicle instead of three, and with a smooth instead of a rough bark. The cones are much longer than those of the chil, and its wood is superior, forming the chief material for house building at Murree. The "pelundai," *Abies*

MURREE

smithum is very abundant. It is tall, straight, and handsome, ranging from 7,000 to 10,000 feet. Trees 10 feet in circumference, 3 feet above the ground, and 100 feet high are not uncommon. The wood is white, and though occasionally used for bearding, is not so good for beams, as it rots quickly if exposed to damp. There are three species of oak, 'my' *Quercus incana*, never attains a great size. It has a range from 4,000 to 7,000 feet, and frequently forms fine woods on the northern slopes. 'Bunugi, *Quercus laetifolia* is a magnificent forest tree, seldom seen below 6,000 or above 7,500 feet. The leaves of the young trees are covered with prickles which are 12 feet in girth, and from 80 to 100 feet high. "Buchi," *Quercus ferox* and *Q. laetifolia* is not common, its timber is very hard and much valued. The maple, 'tik-kadia, *Acer cultus*, is abundant near Murree, but generally small. On Mochnia there are several large specimens of plane, *Platanus orientalis*. It has convalescent accommodation for 300 men and 117 women. Its population in the season is about 1,000 Europeans and 3,000 natives. Chokei broke out in 1858 and 1857 — *Gleghorne's Punjab Record*, p. 198.

MURREE and Boogtee are tribes dwelling in the hills forming a continuous boundary of Sindh and the Punjab. Near Murree the great Suliman range extends in almost a straight line parallel to the Indus for 300 miles, approaching its termination and joins the Maru Moma, which leads on to the Murree hills behind which lies the table land, where Lahore, the capital of the Marice tribe is seated. But in front of these Murree ranges there rises a series of sterile rocky hills, which run towards the Indus, and form their base into a apex near the Gurdhara pass, approaching to within a few miles of the river bank. It is at this point (Shiwali) that the continuous boundary of Sindh and the Punjab has been marked off. These last-named hills, projecting into the Lower Derajat, opposite the cantonment of Asnee, are very thinly peopled. They are crossed by passes leading towards the Murree hills, and are claimed partly by the Murree tribe and partly by the Boogtee tribe, whose hills lie further to the south, but in fact they are not held in strength by any tribe. It is seen, therefore, that the Murree and Boogtee hills, properly so called, are continuous with the Punjab frontier. The head-quarters of both these tribes are situated within the political circle of the Sindh authorities and the relations with both are generally carried on through that medium. The Marice are a

MURSHID

strong tribe, numbering 3,000 or 4,000 fighting-men. They occasionally committed raids in British territory, in the lower extremity of the Derajat. In 1850, one case was reported against them, in 1853, two, in 1854, one, in 1855, one. They once threatened Rojhan and Kusmoir, but dispersed, seeing that preparations were made to receive them. They once attacked a forager's guard from a Cavalry Regiment at Asnee, and killed several men. Living at some distance in the interior, they cannot well make inroads upon British territory without guides. Some of the Boogtee men are serving in the Punjab Cavalry, and many are in the Sindh service. They are subjects of the Khan of Kelat. The original hindoo inhabitants of the Murree and Boogtee hills were driven out by their present occupants, but the natives of Barkhan (the Khetianee) inhabiting the more mountainous district to the north-ward, were able to hold their own. See Beluchistan Khelat, Khyber.

MURRIANE CUP The fragments of a miniature cup, the little Cambay stone cup still made in Cambay, were exhibited in the theatre of Nero, as it adds Pliny, they had been the ashes of "no less than Alexander the Great himself." Seventy thousand sesterces was the price of one of these little Cambay cups in Rome in the days of Pompey. The price in Bombay ranges from Rupees 18 to Rs 35 and Rs 75. Nero paid 1,000,000 sesterces for a cup, a fact, shrewdly remarks Pliny "well worthy of remembrance that the father of his country should have drunk from a vessel of such a costly price."

MURRI NEEN, BURM A tree of maximum girth 2 cubits and maximum length 15 feet. Found abundant all over the Tenasserim provinces on low grounds. When seasoned it floats in water. It looks exactly like deal, but is stated to have no durability — *Captain Dance*.

MURRUWAT, AR Generosity, the noble part of human nature, the qualities which make a man — *Burton's Pilgrimage to Meccah*, Vol I, p. 56.

MURSEEA, an elegy, dirge or funeral enlogium, lamentations, mourning over the dead. *Museca Khwance*, repeating or singing *Museca*.

MURSHEDABAD, a district of Bengal, on the S W of Malda and Rajshy, but separated from these by the Ganges. Murshedabad is 121 miles from Calcutta and is famed for its silk. See Jains.

MURSHID AR. A religious teacher, head of a body of darsesh or fakirs. *Ishad* AR. an order. A murshid is allowed to admit pupil or disciples into the order, as the

MURWY KOLI, one of the balotti, in every village in the northern Konkan, and in Bombay families, they are employed as palanquin bearers. Some Koli are settled as soldiery in Angul Kolaba and at Bombay and Kolaba, in 1837 were 1,000 families

MURWT

and 500 to 600 families at Barsom, employing themselves as fishermen and seamen. At their meetings, whether for congratulation or condolence, they consume large quantities of spirits.

MURWT, an agricultural and pastoral district of frontier Affghan, within the British territories, stout, active men. The valley of Murwat, with its thirsty Murwafect and fine people is the very opposite of Barsoom with its rich harvests and vicious inhabitants. There are two streams, but no well or water courses. Described is the term applied to the territories styled Dakh Edmud Khan and Dakh Chahar Khan. The Dakh Edmud district is divided into two parts by a range of hills running at nearly right angles from the Sukman range to the Indus. The passage from one part of the district to the other is through the Pizoo or Mulge passes which intersect the range. Beyond the passes there is the valley of Barsoom with its Wuzm tribe. The Barsoom is to a certain extent a nomadic tribe. They cultivate with some industry, and are well affected to the government. Beyond the valley, and immediately above the Murwat. The Murwafect are a brave race, of striking appearance, loyal to government and both willing and able to check the depredations of their bad neighbours. In the hills near the Pizoo passed well the Barsoom once a robber tribe, but reformed since annexation. Their cooperation against the Mshood Wuzmree could be relied upon. Below these are two important families, namely, the Gattapoor of Koli chet, and the chiefs of Turk. These two tracts are exposed to attack from the Shormee and Wuzmree. The revenues of Koli chet in 1876 amounted to between Rupees 8,000 and 10,000. Of this the Gattapoor receive 20 per cent on condition of good service in defending the tract. The Turk chet had a lease of the revenues of that tract, he made the collection, which amounted to Rupees 65,000 per annum, and received one-third for himself and the establishment he maintained. This lease was conditional on good service in defence of the tract. The chet, Shah Nawa, is a Pathan of good family, he was elected by the Sikhs, and after many vicissitudes of fortune he was restored in 1818, at the instance of Major Dalwides. There is also the nawab of Dehra Ishmel Khan, he belongs to the princely race of Suddoozye, and was formerly the lieutenant of the Doonance government in the Upper Derajat and Lower Sindh Segm Deah. He

MUSA

for its size, as one would suffice for four men—referring most probably to a bunch of plantains. In the middle of the 19th century, the natives of the south of the Peninsula of India, seeing the spare form of Sir Arthur Cotton, R E., and his indifference to food when work was to be done, content with a plantain or two, gave credence to the story that he had a miraculous plantain which never decreased though continually eaten by him. Pliny, evidently describing the same plant, informs us that its name was Pala, and in Malayalam it is Vella and in Tamil Valle. Every part, both of the sheathing and the exposed parts of these leaves, abounds in fibre. In the Philippine Isles, *Musa textilis* is indigenous. In the Indian Archipelago, the edible species are common, they extend northwards as far as Japan, in China are found *Musa cocinea* and *cavendishii*, also along the Malay Peninsula to Chittagong—*M. glauca* being indigenous in the former, and *M. ornata* in the latter locality. In the valleys of the south of the Peninsula of India and of the Dindigul Mountains, *M. superba* is found. The common edible varieties of *M. paradisiaca* flourish even in the poorest soils, and also near blackish water. They are extensively cultivated in the interior of British India. On the Malabar Coast, the plantain is everywhere at home. The fruit of those at Bassein is especially well-flavoured, and the plant is particularly abundant in the district of Broach. The plantain is found in the highest perfection in Tenasserim, especially in the province Amherst. More than 20 varieties are known, of which several are peculiar to the country, and the greatest part of them are superior to any to be got in Bengal. They thrive well everywhere without the slightest care. No Burmah or Karen house is to be found without a plantation of plantains. As the latter leave their abodes, at least every 3 years, in order to migrate to fresh localities, they are, of course, obliged to leave their plantain gardens behind them, and therefore these may be found growing luxuriantly in many uninhabited places, until they become choked up by the growth of the more vigorous jungle trees. Natives of Bengal generally prefer the large and coarse-fruited kinds, while the smaller and more delicately tasted fruit is alone esteemed by Europeans. These are cultivated in the most northern, as well as in the southern parts of India, while along the jungly base of the Himalaya there is a suitable climate as far as 30° of the north latitude, for plants of this genus growing in a wild state. That growing in Nepal has been called *M. nepalensis*. A similar

MUSA PARADISIACA

species may be seen growing below the Mussoorie range, as well as near Nahn. The fruit, however, in all these situations consists of little else than the hard dry seeds. A similar variety of *Musa sapientum*, having seeds surrounded with a gummy substance, instead of fruit-like pulp, was found by Dr. Finlayson, on Pulo Ubi, near the southern extremity of Cambodia. In Batavia also, there is stated to be a variety full of seeds, which is called Pisang batu, or Pisang bichu—that is, Seed Plantain. In Kumaon and Gushwal the plantain is cultivated at a great elevation as 1,000 and 5,000 feet above the sea, and has been seen as far north as the Chumba range at an equal elevation. Major Munro has seen the wild plantain at 7,000 feet above the sea, in the Kondah slopes of the Neilgherries. Though many of the *Musa* plants have been mentioned as distinct species, it is probable that some, at least, are only varieties. As stated by Mr. R. Brown, nothing has been advanced to prevent all the cultivated varieties being derived from one species, *Musa sapientum* (also called *M. parviflora*), of which the original is the wild *Musa*, described by Dr. Roxburgh as grown from seed received from Chittagong. Mr. Brown further adds, that it is not even ascertained that the type of any of the supposed species of American Banana, growing without cultivation and producing perfect seed, have anywhere been found. Plantains and bananas are extensively cultivated in various parts of S. America, and at an elevation of 3,000 feet in the Caraccas. They are abundant in the W. India Islands, as well as at considerable elevations in Mexico. To the negroes in the West Indies, the plantain is invaluable, and like bread to the European, is with them denominated the staff of life. In Guiana, Demerara, Jamaica, Trinidad, and other principal colonies, many thousand acres are planted with the plantain—Dr. J. Forbes Royle *Illustr. of Himal. Bot.* p. 355. Royle, *Fib. Plants*. Of this delicious fruit there is a great variety in the E Indies. The natives consider plantains as highly nutritious and eat them with cow's milk and sugar as Europeans do strawberries. Europeans also fry it, with butter, and eat it dusted with sugar. A dye is obtained from the skin of the fruit. Its leaves afford a fibre suited for certain purposes but inferior in point of strength to Manila hemp, the fibre of the *Musa textilis*. The stems also yield a fibre. The stem is placed on a board, and the pulpy mass scraped out with a blunt knife, whilst clean water is poured on to wash away the remains of the pulp, the fibres are then dried in the sun. The stalk seldom exceeds seven or eight inches in diameter, and twenty feet in height, bears but one bunch of fruit and dies, but it throws off new plants. The leaves, when young are beautiful (examining with a smooth surface, and vivid green, to six feet in length, and two or more in breadth but, soon after attaining full size the edges become torn by the wind. The flower is very large, purple, and shaped like an ear of Indian corn. At the root of the outer leaf, a double row of the fruit comes out half round the stalk or cob. The stem then elongates a few inches, and another leaf is deflected, revealing another double row. Thus the stem grows on, leaving clear of the flower and a bunch of the fruit every few inches, till there come to be twenty-five or thirty bunches, containing about one hundred and fifty or one hundred and eighty plantains, and weighing from sixty to eighty pounds. The weight bends over the end of the stem, and when ripe it hangs within reach. Like the palms, it has no branches. In the E Indies, it is for the fruit, as a dessert, that this plantain is cultivated, but Humboldt calculates that thirty-three pounds of wheat, and ninety-nine pounds of potatoes, require the same surface of ground, that will produce four thousand pounds of ripe plantains, which is to potatoes as forty-four to one, and to wheat as one hundred and thirty-three to one. There are as many varieties of this fruit in Burmah as there are of the apple in England and America, some preferred for cooking, others for eating in a raw state, some sorts grow wild, but in general it is

MUSA TEXTILIS

exclusively the result of culture. Banana, is a West Indian and Tropical American term for the plantain tribe the Musaceae to which, in India, the term plantain alone is given. The edible varieties extend through the Indian Archipelago, northwards as far as Japan, while in China are found *M. coreica* and *M. Cavendishii*. Agun *M. glauca* is indigenous along the Malayan peninsula. Dr Helfer mentions that 20 varieties are found in the Tenasserim Provinces, and *M. ornata* grows in Chittagong. The Malays reckon forty varieties of the cultivated banana, and the Philippine islanders carry them to fifty-seven, both people having a distinctive epithet for each variety. The qualities are as various as those of apples and pears in Europe, the ordinary sorts being very indifferent fruit. In Khasia the name of the wild plantain is Kanem, and the cultivated Kakesh — *Amshie*, *Mutera India*, p 261. *Cut Ex 1862 Malcom's Travels in South Eastern Asia*, v 1 pp 177, 178. *Hooker Herb Jour Vol II* p 268, *Royle's Fibrous plants*, *Crauford's Du*, p 31. The Fibre

Bandala, Tag

A plant of the Philippines, said also to grow wild on the western ghats of the Peninsula of India, from Cape Comorin northward, but, hitherto, it has not, there, been turned to any account, in the northern slopes of the Ghats, the plant does not reach a height fitted to afford a fibre of more than two feet in length. Its strength is well known to the Ghat people who employ it occasionally for domestic purposes in rope-making as well as the stem for food. Professor Bickmore states (p 310) that in Malabar, this plant is raised from seed, and in the Philippines its fibre is called "bandala," the plant itself receiving the name of Abaca. The plant grows freely at Singapore, from which it was introduced into Madras by Colonel Balfour C B of the Madras Artillery but it seems to have again been lost sight of. It is however a native of the Philippine and of some of the more northerly of the Molucca Islands. On account of its fibres it is extensively cultivated in the first of these, particularly in the provinces of Camarines, and Albay in the

great Island of Luzon, and in several of the Bisaya Islands, a range lying south and east of it. The name abaca belongs to the Tagala and Bisaya tongues, but is not the generic name of the banana in either of them. By the Spaniards of the Philippines the plant is known under the name of arbol de canamo, or the hemp tree, from which is derived the commercial term "Manilla hemp." The natives distinguish several varieties of the Abaca, viz

Abaca brava (the wild Abaca), called Agotai by the Bicol

Mountain Abaca, the fibres of which only serve for making ropes, that are called Agotag and Amoquid in the Bicol language

The Sagig of the Bisaya

The Inquis of the Bisaya, by whom the fibres of the original Abaca are called Lamot. Rumphius states that the Malay name is Pissang-ntan, that it is called in Amboyna, Kula abbal, in Ternate, Fana, and in Mindanao, Coffo, as also the cloth made from it. He distinguishes the Mindanao kind from that of Amboyna, the natives of the Philippine Islands, are said to apply the same name to the plant and its fibre. It was first called *Musa sylvestris* by Rumphius in his 'Herbarium Ambomense'. It was thought to be a variety of *M. trogloditarum* by Blanco, but called *Musa textilis* by Don Luis Nee, in a memoir which has been translated into English, and published in the 'Annals of Botany,' vol 1, where there may also be seen another memoir, which was sent in French to Sir Joseph Banks. These have been republished in the 'Transactions of the Agric Soc of India,' vol viii p 7, together with a translation by Mr Piddington, of Calcutta, of a notice by Father Blanco, in his 'Flora de las Filipinas'. In addition to these we have a notice in the first volume of the 'Trans of the above Society, 1828, by Mr Piddington himself, one of the gentlemen who escaped the massacre of the English at Amboyna. From these authors we learn that the Abaca is abundant in the volcanic region of the Philippine Islands, from Luzon, in the northern province of Camarines especially, to Mindanao, also in the neighbouring islands, even as far south as the Molucca Islands, that is, in Gilolo. Hence this species may be stated to extend from the Equator to nearly 20° of north latitude. It is propagated easily by the suckers which spring up at the roots of the old plant when it dies. A measure of 5,000 square yards of land will grow 1000 plants. It grows to the height of 13 or 14 feet exclu-

sive of the leaves. The fruit is small, of a disagreeable taste, and not edible. When it is about to form, the plant is cut down, and the stem being cut open longitudinally, is found to contain a great quantity of fibres of various thickness, and usually a couple of yards in length. These are extracted, hackled after the manner of flax, and then sorted. Some of the finest are as slender as a hair of the head, and are reserved for the manufacture of cloth, while the coarser are appropriated for cordage from the smallest rope to a ship's cable. In the husbandry of the Philippines, the abaca is of more importance than cotton. Pigafetta, in his enumeration of the plants of the Philippines on their first discovery, in 1521, does not include the abaca, although he mentions cotton and the esculent banana. Dampier, in his account of Mindanao, where he resided for six months in 1686, gives an ample and accurate description of the textile banana, and the mode of extracting the thread from the trunk. "As the fruit of this tree," says he, "is of great use for food, so is the body no less serviceable to make cloths, but this I never knew till I came to this island. The ordinary people of Mindanao do wear no other cloth." After this follows the account of the process of extracting the fibres, which is well worth perusal. The Dutch have of late years introduced the culture of the abaca into the northern or volcanic peninsula of Celebes, where it seems to be indigenous, and with a fair prospect of success. There is a large exportation of abaca in the forms of raw hemp and cloth, but especially of cordage, from Manilla. Its fibre has latterly been applied to the manufacture of bonnets, tapestry, carpets, hammocks, and net work, the fibre can be bleached and dyed similarly to flax and lint.—*Crawford, Dictionary of the Eastern Archipelago* p 1 *Bulmore's Travels*, p 340 *Royle Fib Plants*, Voyt

MUSCAT, in lat $23^{\circ} 38'$ N long $58^{\circ} 35\frac{1}{4}'$ E on the N E coast of Arabia Sailing northwards from Muscat, the great chain of mountains behind the town known by the name of Jib Akdthui, or the "Green Mountains," is found to be continued on to Ras Mussundum, which forms the western promontory of the Persian Gulf, where they suddenly sink to an altitude of 400 feet, while not more than 30 miles further back there is a point 6,700 feet high Striking, however, as the contrast is at these two points, there are two mountains within sight

MUSCAT.

of Ras Mussundum on the opposite coast which are respectively 8,500 and from 5 to 6,000 feet above the level of the sea, the first, which is Jibl Shameel, is about 70 miles northward, and the other, called Jibl Bees, about 60 miles eastward These must be regarded as the two pillars of the straits on the eastern or Asiatic side Towards the end of the 17th century Muscat Arabs having driven the Persians from Oman, established their ascendancy in the Persian Gulf, and gained a footing in Zanzibar and several other parts on the African coast In Nadishah's reign, the Persian authority was partly re-established, but after the death of that king, Almiad bin Saeed, the Arab Governor of Sohar drove the Persians out, and he was elected Imam He was succeeded in the Government of Muscat by his second son Syud Sultan, who usurped the rights of his elder brother, Syud Sultan was killed on 14th Nov 1803 in battle with his enemies the Uttoobi and Joasmi The rights of his two young sons were disputed by their uncle Syud Ghes of Sohar, who aimed at usurping the government of Muscat During this disputed succession, Bunder Abbas and Hormuz had been seized by the shah of Kishm, but these were recovered by the aid of the Wahabi sectarians The weakness resulting from this disputed succession gave the Wahabees a footing in Muscat, which they have never wholly lost This sect adopted strict and puritanical doctrines They denied divine honours to Mahomed, abhorred and destroyed all holy tombs, abstained from the use of tobacco, and waged war against all mahomedans who did not accept their peculiar views Their doctrines spread with amazing rapidity In 1800 they made their first appearance in Oman They reduced all the sea coast of the Persian Gulf from Bussora to Debaye, released the chiefs of Zaheera and Sohar from allegiance to Muscat, and forced Syud Sultan to beg for a three years' truce, which they broke soon after They would probably have conquered all Oman if they had not been stopped by the assassination of their chief The Wahabees reached the height of their power shortly after the accession of Syud, Saeed the second son of Syud Sultan, who succeeded Budi bin Halol in 1807 This chief, to whom the religious title of Imam was not conceded by the Arabs, although he is generally so styled, ruled for 50 years, during which time he cultivated a close intercourse with the British Government In 1808, the Imam, smarting under the insults of the Wahabees, whose agents were forcibly converting his subjects in his very

capital, roused the Arab tribes in Oman to a combination against them. If Muscat had fallen under the Wahabees, the Imam would have been drawn into the general system of piracy which the Wahabees encouraged, and would have been converted from a friend into a dangerous enemy. The British Government, therefore, resolved to support him. An armament was accordingly sent towards the close of 1809, which destroyed the piratical boats at Ras-ool-khyma Linga, and Luft, and bombarded and took Shinas. No arrangements, however, were made permanently to secure the advantages then obtained. Piracy was soon renewed, and another expedition had to be sent against the pirates in 1819, in which also the Imam co-operated. With these exceptions, till the year 1822, when a treaty was concluded for the suppression of slavery, there is nothing requiring special notice in the intercourse between the British Government and Syud Saeed, who was chiefly occupied in wars with his rivals, the Joasim, and in fruitless attempts to possess himself of the Island of Bahrein. During the later years of his rule the affairs of Syud Saeed in his Asiatic dominions fell into much confusion, owing, in a considerable degree, to his prolonged residence at Zanzibar, which, in 1840 he made the permanent seat of his government, and the incapacity of the agents whom he left at Muscat, and latterly of his son Syud Thowaynee. On more than one occasion his power was saved only by the intervention of the British Government. The Wahabees forced him in 1833 to pay them a tribute of 5,000 crowns a year, and to renew the obligation in 1845, raising the tribute to 20,000 crowns, 12,000 being for Muscat, and 8,000 for Sohar. About the same time also he got into trouble with Persia regarding his possessions on the Mekran coast. Besides his possessions on the Arabian and African coasts, the Imam holds the Islands of Hormuz and Kishm in the Persian Gulf, and is acknowledged as feudal lord by the Arabs on the Mekran coast between Jask and Bassem. He holds Bunder Abbas and its dependencies on rent from Persia. He also holds the ports of Gwadur and Charbai, his rights to which, according to tradition, were derived from the Khan of Kelat. In 1846 Hussein Khan, the Persian Governor of Fars, despatched a force against Bunder Abbas with the view of extorting a large sum of money from sheikh Seif bin Subhan, the Imam's deputy and governor. The Imam threatened to retaliate by destroying Bushir. It was not till a change of ministry took place on the death of Mahomed

Shah that redress was granted to the Imam. In 1853 the Shah of Persia resumed possession of Bunder Abbas and its dependencies, but he restored them to the Imam in 1856 on much less advantageous terms than formerly. The rent was raised from 6,000 to 16,000 tomans a year, and the Islands of Hormuz and Kishm, the Imam's hereditary possessions, were ceded to Persia. In 1854, the Imam ceded to the British Crown the Koonia Mooraa Islands on the south coast of Arabia. The islands are valuable only for the guano deposits which are formed on them. Syud Saeed died 1856. In 1844 he had intimated his desire to appoint his sons Syud Khalid and Syud Thowaynee as his successors in his African and Asiatic dominions respectively, and had appointed them his deputies. Syud Thowaynee accordingly succeeded to the government of Muscat on his father's death. In virtue of his succession to the chiefship of Oman, he claimed also feudal supremacy over Zanzibar and prepared to establish his claim by force of arms. The dispute was submitted to the arbitration of Lord Canning, who decided that Zanzibar should be independent of Muscat, but should pay an annual subsidy of 40,000 crowns. The present ruling family of Muscat are, as has been already noted, descended from Ahmed bin Saeed, the Governor of Sohar, who, in 1730, expelled the Persians and became the first Imam of Muscat. On the death of Syud Saeed, his son Syud Toorkec, who had been placed in the government of Sohar made several unsuccessful attempts to make himself independent of his elder brother Syud Thowaynee and to create a rebellion in Oman. Muscat is inhabited $\frac{1}{2}$ by mahomedans the other $\frac{1}{2}$ being Hindus, Ludianas, Sikhs, a few Jews and Parsees, Biadiah and Negroes—*Palgrave's Treatise, Engagements and Summuds*, vol vii pp 200, 208, 199 to 206. *Colonel Chesney, Euphrates and Tigris*, p 41. See Imam, Kishm Island.

MUSEUM, is a word derived from a Greek term signifying a temple of the muses but as used in Great Britain and in British India, it designates an institution in which are lodged specimens of the animal, vegetable and mineral kingdoms, and those illustrative of Economic Geology. There is a Government Central Museum at Madras, a Mysore Museum, at Bangalore, formed in 1850 and 1865 by the Editor, an Imperial Museum at Calcutta, the foundation of which was

MUSEUM

the Museum of the Bengal Asiatic Society there is also a Museum at Bombay, one at Tirvandrum and one at Vizagapatnam

The Madras Museum is free to the public, who formed it by their liberal donations to the collections, the number of visitors amounted in the year 1855, to 201,987 and in the year 1856, 312,866. The number will be regarded as considerable when it is mentioned that the visitors to the British Museum in 1855 were only 331,989, to the Royal Zoological Gardens in 1854 they were 107,676, and in 1855, to the New Gardens 318,818. Excepting specimens illustrative of Botany, the Government Central Museum at Madras, in 1859, in its objects, embraced Economic Geology and all the branches of Natural History, a Zoological Garden, a Public Library, and collections of coins and antiquities. The probability is that there were many students of Natural History, in the most ancient times, for, in the overwhelmed city of Pompen, destroyed in A D 79, by lava, in the room of a painter, who was probably a naturalist, a large collection of shells was found, comprising a great variety of Mediterranean species, in as good a state of preservation as if they had remained for the same number of years in a museum. We know, moreover, that on the revival of science in western Europe, after the fall of the Greek or Constantinopolitan Empire, the princes and nobles formed collections of relics of art, of specimens of natural objects and other productions, constituting cabinets and museums. The discovery of busts, statues, bas-reliefs, inscriptions, and other antiquities of various kinds, led to the formation of many museums in Italy (where such subjects abound), earlier than in other countries, the Medici, Dukes of Florence, particularly signalling themselves by the liberality and magnificence they displayed in procuring relics of antiquities, and valuable manuscripts and works of art, at a vast expense. In the 17th and 18th centuries numerous museums, some exclusively appropriated to objects relating to one science only and others of a more miscellaneous nature, were formed not by kings and princes only but by numbers of private persons, some of whom devoted themselves to the task of collecting during a considerable part of their lives, travelling foreign countries, regardless of all toil or danger, other individuals, favored by fortune, were enabled to employ their wealth in making rich and abundant collections of curiosities, availing themselves of the services of men of science and research, who explored the world at their ex-

MUSEUM

pense In England, John Tradescant collected curiosities of various kinds and his museum constituted the nucleus or foundation of the famous Ashmolean Museum at Oxford James Petiver, a London apothecary, formed a cabinet of natural history, in Holland, Albert Seba distinguished himself as a collector of similar curiosities, and in that country, also, John Swammerdam devoted much time and labour to the study of entomology or the natural history of the insect tribes, and to the formation of a valuable museum The Ashmolean Museum, was presented in 1686, to the University of Oxford by Elias Ashmole, an eminent herald and antiquary It comprised originally specimens to illustrate natural history, and various artificial curiosities, especially Roman antiquities, and since its establishment numerous additions have been made to it Among the most celebrated collectors in England during the 18th century may be reckoned Richard Mead, an eminent physician, who accumulated a valuable cabinet of coins and medals, besides other interesting objects, his rival, Dr John Woodward, who applied himself especially, but not exclusively, to the collection and illustration of British minerals and fossil remains, and Sir Hans Sloane who, at his demise, bequeathed to Government his magnificent museum and library, in the formation of which he had expended upwards of 5 lacs of Rs This formed the foundation of the British Museum to which has since been added the donations of many eminent and great men as well as the extensive collections which the large annual grants from the Imperial Parliament, reaching latterly to 5, 6 and 7 lacs of rupees for all purposes, have enabled the trustees to purchase The Imperial Parliament granted £85,000 or eight and a half lacs of rupees for the expenses of the British Museum for the year 1856-57 The British Museum is not supplied with professors to instruct those desirous of information, but has a large staff of officers, whose employment it is to superintend the arrangement, preservation and exhibition of the objects of various descriptions comprised in the collection This consists of a Library of printed books and manuscripts, objects of natural history in the animal and mineral kingdoms and a magnificent collection of sculptures, coins, drawings and engravings Its objects, it will be observed from this, are few, nevertheless, it is the most extensive in Britain, perhaps in the world, though there are in London, Edinburgh, and Dublin, indeed in nearly every large town in Britain, museums which have attained a considerable size On the conti-

MUSEUM

ment of Europe, picture galleries, sculpture galleries, and collections of natural history are to be met with in all the principal towns, and in the United States of America the collections that have been made to rival those of the old world The oldest museum in India was that of the Asiatic Society of Bengal, which includes a Museum of Natural History and a Museum of Economic Geology, of which Mr Blyth and Mr Piddington, for many years had been the respective curators, and under whose care great extensions were made Dr Oldham, the Supt of the Geological Survey established in Calcutta, a Geological Museum, of which that hitherto in charge of Mr Piddington, formed the nucleus The Bombay Asiatic Society likewise possessed a museum, particularly rich in specimens of natural history, and which has been greatly indebted to Dr Carter's efforts, and Bombay also had an Economic Museum which originated in Dr Buist's exertions and which Lord Elphinstone took under the care of Government, placing Dr Impey in charge A museum existed at Singapore, one also at Agia, one at Roorkee, and one at Saugor These institutions all originated and are nearly all of them supported by the European population of their respective communities, but it is the Madras Government to whom is due the credit of being the first of the governments of this country to establish museums as institutions of the State, and under their auspices, museums of Natural History and Economic Geology authorized six local museums, at Bellary, Cuddalore, Coimbatore, Mangalore, Ootacamund, and Rajahmundry, Lieut Winscom formed one at Jubbulpore, and His Highness the Rajah of Travancore one The numbers of such institutions already existing and their steady increase, everywhere, imply that they provide for some want that is generally felt, and such is, in truth, the case, for to all engaged in particular scientific pursuits, museums, whether they be their own private property or belong to the public, are essentially necessary to enable them to follow up their own investigations, and institutions of this kind afford amusement and instruction to all who take an interest in examining the works of nature and of art On taking a leisurely survey of a well stored and well arranged museum, the thoughtful observer cannot fail to be struck with the endless variety of forms and the wonderful adaptations of means to certain appointed ends which abound in the kingdom of nature Every single specimen, whether it be of an animal, a plant, or a

MUSEUM

MUSEUM

mineral, has a history to tell, full of design, abounding in instruction, and replete with beauty. All these varied forms, gathered from all parts of the earth, grouped with the method and order of a scientific mind, are, to a certain extent, exponents of the method and order of the divine Architect, who in planning the fabric and willing the existence of the means of His creatures, had in view certain wise and benevolent ends, which it is our duty and privilege to study, and as far as possible to understand. It may in many cases be difficult to see the uses of beings and objects on which so much care has been bestowed, and for whose propagation and preservation so many precautions have been taken, but we must bear in mind, that the use of an object does not always meet in its direct application to the wants of the pleasure of man. It doubtless has its uses in the great scheme of nature, and as such the naturalist regards its economic application as of secondary importance. Hence, it is rightly viewed, that for a single object, however mean, which does not in some way or other appeal to our sympathy, excite our interest, and confirm our belief in the constant care of a protecting Providence. But visitors who enter a museum can rarely hope to experience such pleasing emotions as these, and it is to be feared that it is but too common in occurrence for many who enter institutions of this kind to quit them again with only some vague indistinct idea of having seen many curious things of which they know neither the objects nor the uses. Such profitless termination of a sight seeing is the result solely of the collections being examined without any definite purpose. By attempting too much, by trying to learn at one or even at a few visits all that a museum can teach, the mind becomes bewildered amongst the multitude of things that meet the eye, and in reality requires no distinct knowledge of any thing it contains, for it is impossible for a person to promiscuously examine all in the museum, however methodically arranged it be, as to acquire a knowledge of all in the animal, vegetable and mineral kingdoms, and in the arts and manufactures (of specimens from all which museums are composed), without that close attention and prolonged study which the acquisition of every branch of knowledge demands. If visitors then sight seeing they must enter such institutions with some definite object, otherwise they will return carrying with them only indistinct glimmerings of information, vague, undigested notions of the many curious things that they had just seen, the nature, uses, or even forms of which, however, had made so little impression upon their minds that they cannot be recalled with vividness sufficient for any useful purpose. In establishing at Madras, the Government Central Museum, it was from the first intended to form a central institution connected with branch museums or repositories in the provinces, all working together and affording mutual aid by an exchange of specimens. The notification of the 11th August 1851, also mentioned that the central institution should combine the objects of a Museum of Natural History and a Museum of Economic Geology, and that the Officer in charge would occasionally print and circulate notes and extracts from publications on points connected with subjects likely to be of use. Of those objects some have been fully carried out. Amongst the periodical returns transmitted to Government, reports on woods, non ores, marbles, sandstones, grinding materials also were published, and arrangements were made for establishing local museums in the larger towns. It consists of a Museum of Natural History, of Geographical Geology, of Economic Geology, and a public library. In the latter considerable progress has been made, and the foundation having been laid it can be rapidly increased whenever desired. The Museum of Economic Geology has aided in extending amongst the community a knowledge of the raw and manufactured products of this country, a report on the marbles of Southern India and another on this country's non ores and non metal and steel, have already appeared, there are ample materials in this collection for hundreds of such resumes. The articles in the Economic Museum have been arranged upon the plan adopted in the Grand Exhibition of 1851, under the four Sections of Raw Materials in the mineral, vegetable, and animal kingdoms, Machinery, Manufactures, and Sculptures, Models and the Plastic Art, the progress may be judged of by mentioning that this department contains about 10,000 specimens in all its sections. The Museum of Geographical Geology contains a very extensive collection of specimens of the rocks and minerals from the provinces over which the army of the Madras Presidency extends, and all so arranged that the geological features of each civil and military division can be studied separately. Museums were formed at six places, namely, Bellary, Coimbatore, Cuddalore, Mangalore, Ootacamund, Rajahmundry. All within the civil provinces of the Madras Presidency. But in addition to these, there is a

MUSEUM

museum which has, for some years past, been in existence at Singapore, another was established at Jubbulpoire, and a third at Trevandrum

MUSHK WALI

An institution was commenced in Calcutta, in 1866, as a National Museum for India, of which the extensive and valuable collections of the Bengal Asiatic Society formed the nucleus of this Museum. It has rapidly increased since 1866 in the Natural History department and a two storied building to cost about £100,000 is to be erected for its reception. The building faces the Maidan and is of great extent. Dr Anderson, who was in charge of it sent collectors out to various parts of India, and the neighbouring countries, in 1870, he had a man in Persia, another in Yarkand, and a third in Nepal, one in the hilly region of eastern Assam, and another in Atrakau. Collectors for this Museum accompanied the Abyssinian Expedition, Dr. Anderson was naturalist to the Yunan Expedition with two collectors attached to him. The present officers are the Curator, the Assistant Curator and the Librarian who is also Assistant Secretary. It is the intention of Government to form a Library on a large scale in connection with the Museum but in the meantime and until the new building is completed, it is confined almost exclusively to Natural History.

MUSHAEKH, ARAB A patriarch or devout man, a religious teacher.

MUSHARI, See Kummalei.

MUSHED, the capital of Khorasan. It was for some years the residence of the court of Nadir Shah—*Malcolm's History of Persia*, vol ii p 216. See Kuzilbash, Kavi.

MUSHINA, also Musina, BENG Linum usitatissimum, Linn.

MUSHI-RANG, HIND rat color.

MUSHK, AR HIND PERS Musk.

MUSHKAM, TEL Bignonia, sp.

MUSHK-DANA, HIND or Hubb-ool-moo.

MUSHK, HIND or Hubb-ool-moo.

MUSHKI, a western division of Beluchistan. Mushki has several towns and castles, and is occupied by the Mehmasani, the Nousherwan and Mirwan tribes. The Mirwan Brahui are located in Mushk, Jhow and Kolwah. The Brahui entered from the west and point to Khozdar as the capital prior to occupying Kalat. See Kelat.

MUSHKI also Mushkan, HIND a scented kind of rice.

MUSHKIARA, HIND Sambucus ebulus.

MUSHK KAFUR, HIND Laurus camphora.

MUSHK-NAFA, HIND the musk bag of the musk deer.

MUSHK TARA MUSHI, HIND Men-tha incana.

MUSHK WALI, HIND Valeriana Walli-chu, bed-i-mushk, HIND is Salix caprea.

MUSHROOM

faranj mushk, HIND is Calamuntha umbrosa, also Ocimum basilicum.

MUSHOOD WAZIRI, a tribe of the Waziri Afghans, near the Khyber pass.

MUSHRIFF, ARAB PERS HIND A cashier.

MUSHRIK, AR One who gives a companion to the Almighty, a term used by Mohamed in the Koran to designate Christians.

MUSHROO, HIND stuff of silk and cotton Satins, the back or warp of which consists of cotton.

MUSHROOM The Agaricaceae, the Mushroom Tribe of plants, the Fungaceae of Lindley, comprise mushrooms, puff-balls and Mildews. They grow on the earth, and on decayed animal and vegetable substances, scarcely ever on living bodies of either kingdom, in which respect they differ from lichens which commonly grow on the living bark of trees. Dr Royle's collections in the Himalaya, amounted to about forty specimens. Some of the fungi are used as food, others are poisonous, others are parasites and destructive to the plants on which they grow.

The Agaricus campestris, the common mushroom, the various species of the Helvella or morel and of the tuber or truffle are all useful as food, but there is great difficulty experienced in distinguishing the poisonous from the edible kinds and only such should be eaten as are raised in gardens in mushroom beds. The Koodiat mushrooms are often seen in the Tenasserim bazaar, and the Karens have names for sixty-four different species of mushrooms and the allied fungi. They distinguish the edible from the poisonous kinds, they say, by touching them with the lime that they eat with the betel. If the fungus turns red when touched, it is regarded as poisonous. But they are so careless or ignorant, that sickness and death often ensue after eating them. A new mushroom collected from the stumps of trees Agaricus (Pleurotus) subocreatus is a dendriophyal species, dying readily, is employed in the Straits settlements as an article of food and is nearly allied to the British Agaricus ulmarius, from which it is separated by the volva, remains of which may be traced at the base of the stem. Mr Powell says, there are three kinds of edible fungi in the Punjab, viz the Samarak or Samarugh of the Panjab, also the morel Morchella esculenta, (Phallus esculentus) and the truffle Tuber cibarium, or allied species, called khumba, and knambur. The Agaricus campestris mushroom.

room is usually called "pad baheia," and the morel, "guchi," or "kama guchu." Dr. Henderson mentions that in Shahpur and other districts, where there is "kahi" in the soil, the morel and mushroom are both abundant, the former in August and September, the latter in the end of the cold season, after heavy falls of rain. Mohamedans eat only the morel, and consider the mushroom as "haram" or unlawful food. Natives say that every mushroom having a pleasant smell and taste is wholesome. In the Jhang district, an underground morel, called "phaphoi," is found in fields of Jawar (*Holcus sorghum*), and Edgeworth, in the "Flora Malacca," mentions an esculent morel, which he calls "banphal, literally wild fruit." It is said that the morel and agaricus have both narcotic effects when eaten. Quantities of the morel are brought from Kashmir to Amritsar. The khumba, or khambur of Muzaffargarh, is of a pure white color, with a powdery surface and destitute of gills, it is very common in the rains, and is much esteemed as an article of food. Fried in the ordinary way they are equal in flavor to English mushrooms. They are called khumba, and when very large kham-bur. The Morel (*Morchella esculenta*), called "kama also kachu," are imported into India from Kashmir.—*Royle Ill Himalayan Botany*, 440. *Riddell D. Mason's Tenasserim*, Dr. O'Shaughnessy, *Beng Disp.* Dr. Honningberger, p. 223. See Agaricus, Fungus.

MUSHTARI, or Mushtari. AR the planet Jupiter.

MUSHTEE, also Mushtighanga musidi, TEL. *Strychnos nux vomica*.

MUSHTIGAR, KARN. A tribe in Mysore calling themselves Kshatriya and following agriculture but in some respects resembling the Jatti or boxers. This seems a misprint for Kushtigai, a wrestler.

MUSIC. An account of the state of musical science amongst the Hindus of early ages, and a comparison between it and that of Europe, is yet a desideratum in Oriental literature. From what we already know of the science, it appears to have attained a theoretical precision yet unknown to Europe, at a period when even Greece was little removed from barbarism. The inspirations of the bards of the first ages were all set to music, and the children of the most powerful potentates sang the episodes of the great epics of Valmiki and Vyasa. In music, there are two things which should be very carefully distinguished,—the time, and the words or sentences

which are adjusted to the time, they are respectively called in Sanskrit swara and sahitya. For instance, we may compose a verse and adapt it to a certain tune and sing it. When we understand the sense of the verse, there is one sort of pleasure, and when we hear the song, there is another, independent of the former. Though these two sorts of pleasure intensify each other in combination, they are not identical, and some persons confound one of these with the other. In India the hindoo who attentively listens to a Thangam pattu passes for one possessing a fine musical taste, while in reality, he takes no delight in the tune, but revels in the obscene pictures which that vicious ballad recalls to his mind. Such a one as this, when he attends a party where there are able musicians, would ask for a hint of Muttuvayi, a vulgar ballad; and when the musician declines, he will burst into a vociferous criticism against him and say that the fellow knows no music. Some people though they take delight in music and are daily in the habit of frequenting musical parties, erroneously suppose that each one of twenty-four steps of the Veena or lyre, will utter some letter such as ha, hla, ga, gha, &c'. Here are two things confounded, viz, the tune and the letter; there are such absurd hindoos as will say "How pleasant it will be if a musician sings Kalyani ragam on a muthanga or drum" or "if a dancing girl dance to an alapana or suruti." While the reading of the vedas, puranas and other religious books was monopolized by the Vydika religious men and poetry, rhetoric and kindred branches of learning became the hobby of the Lokika or men of the world, music, left without any place and protection, took refuge in brothels. The religious brahmins went so far as to hurl their thunders against those who practised it and said "Gayata na thayam" (that we should not give them any thing). Much attention has not, however, been paid to this injunction and it has often been violated. Europeans have a very low opinion of native music, not certainly founded upon good grounds. Music delights us in two ways, viz, by harmony and melody. The former consists in the agreeableness of two or more sounds uttered at the same time, while the latter is seen in the succession of many sounds. If you take a veena and tightening the strings up to their proper pitch, arrange the sruti properly and touch all of them at once, you have harmony. Your veena may be accompanied by a fiddle having the same sruti, the harmony will be still more pleasing. But if in your veena you touch some of the

MUSICAL INSTRUMENTS

steps with yom finger in succession, you have melody For instance touch the second, third, fifth, seventh, ninth, tenth, and twelfth steps, you have a melodious succession of sounds This succession is called *bnavi* by the hindoos In Sanskrit, harmony is termed *suti* and melody *raga* The natives of India know both harmony and melody and are distinguished for their skill in both The vocal music of Europeans is generally thought by hindus to be unattractive But when ladies sing, their naturally sweet voices are deemed to make up a little for the defects of their music Hindoo music is vaster and more various than that of Europe as may be exemplified in the following manner Take a *veera* or *guitar*, and press the string in one of the steps, and move it to and fro We may hear a gradual ascension and descension from one note to another Thus we produce an intervening note between two notes A variety of notes is thus produced to make the melody more rich

MUSICAL INSTRUMENTS

The mahomedans of India have the following wind instruments, viz,

Zufecree

Putee, a leaf of the *Holcus saccharatus*, *Lin* held between the lips and sounded

Moorchung, or Jew's harp

Shuhnaee, a kind of clarionet, a cubit long, and having a leaf mouth-piece, commonly called *Soomnaee*

Soor, a bass or drone to the *shuhnaee*

Algoa, a small flageolet, a span long

Nagaysui

Poonggee Of this there are two varieties, one made of leather and sometimes accompanies the *kunchuee-ka-tae-fa*, the other of pumpkin, usually played upon by jugglers and snake dancers, &c

Quina, a straight or curved horn, twelve feet long

Tooriee, or *Toortoorree*, commonly denominated by Europeans colley horn, consists of three pieces fixed into one another, of a semi-circular shape

Banka, is the *Tooriee*, with the upper piece turned from the performer, forming it into the shape of the letter S

Banslee, or flute

Sunkh, the Chank or conch shell It is the trumpet of the hindoo temples frequently used by devotees, also as an accompaniment to the *tumkee* Sometimes they play trios and quartettos on the chank shells alone

Nursinga, a sort of horn

The following are the drums, guitars, cymbals, castanets, &c, &c, of the mahomedans, viz,

MUSICAL INSTRUMENTS

Chutkee, or snapping the fingers

Tilee, or clapping the hands

Khunjee, a sort of small tambourin, played upon with the fingers

Duff or *Duffi*, the *tambour de basque*, "tympanum," according to Gentius, *Sadi Resa Polit* p 303 A sort of bass tambourin played upon with a stick

Daeera, the largest variety of tambourin, being from a foot and a half to two feet in diameter, played upon with a stick

Dhol, a larger drum than any of the following, both sides covered with leather, and played upon with the hands

D'holuk, or *Dholkee*, smaller than the preceding, and only one side covered with leather

Meedung, a kind of drum which is an accompaniment to the *kunchuee ka tae-fa*

Pukh waj, a kind of drum, a timbrel

Tubla a couple of drums, played upon at the same time, one with each hand

Nuga

Nugaia, or a kettle drum

Ghumeel, a plate of brass for beating time, a brass gong

Tukkoia, or *Zavibum*, are small kettle drums, one is called *zayi*, the other *bum*

Duuka, or a bass kettle drum, middle size, between the *nugaia* and *tukkoia*

Tasa, or *Tashia-munfa*, a drum of a semi-circular shape, played upon with two sticks, and invariably accompanied by the *munfa*

Munfa, a drum like a *d'hol*, covered at both ends with leather, but played upon only on one side with a stick

Tubul, an enormously large variety of drum, used in the field of battle

Tumkee, a small circular brass plate, played on by striking with a piece of wood, having a knob at the end

Dhubboos, consists of a rod of iron about a foot long, with a knob at one end and a sharp point at the other, having from fifty to a hundred hollow rings, which when shook rattle against one another used by fugues, who wield it about, striking their abdomen of a sudden with the sharp point

G'huma, or empty earthen vessels, or water pots, played upon with the hand

Si-tara three wires, or *Ek Tara*, when with one steel wire, called by the latter name sometimes it has nine or eleven steel wires, but generally three, whence its name, from three, and string or wire

Tumboora, a sort of seeta, (*guitar*), having catgut strings instead of wire

Saung, or *Saungee*, a musical instrument like a fiddle, played upon with a bow

Rubab, a kind of violin or rebek

MUSICAL INSTRUMENTS

Been, or Vina, a sort of seetar but having two dried hollow pumpkins (*Cucurbita melopepo*, *Willd*) fixed to the end of it, with five or seven steel strings, described by Sir William Jones in the *Asiat. Researches*

Keenggeec, similar to the preceding, but having three or four pumpkins, and only two steel strings generally used by hindoos

Qanooi, a species of dulcimer, or harp

Uugun, a kind of organ

Ragmala

Chukua, a kind of violin

Thalce, a flat earthen dish on which they rub and rattle a stick with both hands

Theekice, two bits of sticks or fragments of earthen vessels used as castanets

Doroo, a small double headed hand drum

Surod, a kind of guitar (or seetar), having catgut or silk strings

Duppia

Munjeera, or Jhanjh, a kind of small cymbals in the shape of cups, struck against each other, and accompanying most bands

Tal, cymbals, used by devotees, and frequently as an accompaniment to the tafia

Ghugice, one or two hollow rings with pebbles in them, worn on one or both thumbs, and rattled

Goonghroo, little bells fastened to a string, which is wound round the wrists and ankles, and which jingle at every motion of the limbs

Saz

Seekhan, a piece of iron about a cubit long, with which singers pierce their necks and cheeks. Also,—An Arab musical instrument, used by the Arabians who frequent the Malabar Coast

The following are the musical instruments played as accompaniments to the performances of the dancing girls

Drums—Of these there are two, a large oval shaped one termed a d'hol, and a smaller one of the same shape and make, called a malim moorathungum or mathalum. These are hollow wooden cylinders, large in the centre, and narrowed at either extremity, and covered by parchment at both ends

Thoothe or santoothe, a wind bag, somewhat like a bagpipe, this comprises the entire skin of a sheep or goat, freed of hair and having all the openings closed, excepting two pipes or reed, one of which is inserted in the neck, and the other, at one of the extremities, one to blow with, and the other through which the air issues, producing a low moaning sound

Thalum Two pairs of cymbals, (large and small) termed peria and chinna, thalum

A piccolo, termed poolan kushul

A small flageolet, called mogoveni.

MUSICAL INSTRUMENTS

A large flageolet, called peria walum mogoveni

In addition, they sometimes have a clarinet, violin, tambourine, and guitar, but these are innovations of late introduction. In the performance of the hindoo dancing girls in the two dances termed avancum and kanchene naetum, their movements are combined with great agility, ease, and gracefulness, and with their nimble steps, the turning and twisting of their hands, eyes, face, features, and trunk agree, whilst they beat time with their feet. The feet generally placed flat as they seldom dance on their toes—the movements and position combine something of the waltz and Spanish cachucha—they advance, retire, whirl around drop down and rise again with ease and rapidity, whilst the several movements are kept in order with the twirling and twisting of their hands, features, trunk, &c. Some portions of the step resemble the hornpipe and jig, whilst they hop and dance from one leg to another, keeping time, now turning, now whirling, now capering, and now drooping, performing a coquettish pantomime with their antics, then affecting coyness, and dancing away from the assembly, by suddenly turning away as if careless of their allurements, but returning to the attack with greater vigor and increased blandishments. It is indeed, surprising to witness their feats of strength and bodily powers of endurance, for notwithstanding their frail make and delicate appearance, the amount of fatigue they endure, dancing as they do from nightfall to early hours of the morning is astonishing. Their dancing is perfection, and the bodily fatigue they must undergo, from the attitudes and positions they combine in their dances, must be great. In what is called the "Sterna Cothoo" athletic feats are performed, resting their hands on the ground and flinging their feet in the air with great rapidity and thus twirling round and round, successively performing various somersaults, lying full length on the ground with their hands and feet resting, contorting, twirling, and twisting their bodies in various ways, or whilst resting on the hands and legs with their backs to the ground and their chest and abdomen turned upwards, drawing the hands and feet as close together as possible, whilst their bodies are thus arched they with their mouths pick up rupees from the ground. In this arched position beating time with their hands and feet, they work round and round in a circle. During their performance they join their attendants in the songs that are sung and regulate the various movements of their bodies to the expression given vent to in the song

MUSICAL INSTRUMENTS

Modiye doocoonoothoo—In this dance the word "mod" is a term used to designate a craft or enchantment practised by a conjuror who places or hides money or other valuables in a certain place, and often in the presence of his opponent, with the view of testing his ability, and challenges him to remove it, which the opponent endeavours to do by playing on a pipe termed "maked," and if he be not equally skilled, he is struck to the ground in a mysterious manner sick and ill, frequently bleeding from the nose and mouth profusely. The dance is in imitation of this by the guls playing on a maked, dancing at the same time and throwing herself on the ground—the right leg is stretched out at full length, forming a perfect angle with her body out on one side, on the other, the left leg doubled under the knee is stretched out in like manner on the opposite side, producing a most singular appearance, and as if there were no joint in the hips.

Colu Aulom, or the stick dance, is formed by a number of guls of the same age, size, and dress, numbering from twelve to twenty four, or more, each having two sticks, one in each hand, about eighteen inches long, well turned, and painted with circular stripes of yellow, green and red. Either to the roof or across a piece of wood raised in support for the purpose, a stout skein of thread in different colours is suspended, and having as many strands as there are guls, the free ends of the strands are tied to the ends of the painted sticks each hold, the dance begins with the usual song and accompaniment of music, when each gul striking her sticks dances a kind of jig and hops from place to place exchanging places with each other. This is done with such order and regularity that the several strands are plaited with the utmost regularity into a stout cord or tape of many colours, according to the design. At a sign from the conductor the same is undone, with equal order and regularity, the guls dancing and exchanging places with each other without a single mistake or false step, either in the plaiting or unplaiting of the strands of thread. The readiness, grace, and ease with which the several movements are effected are worthy of admiration. At some places on festive occasions, during the peregrinations of the hindoo idol around the town in procession, these guls perform the stick dance on a platform, which is carried and precedes the idol. More frequently these and other dances are performed on foot in front and at some distance from the procession, which stands still at a certain distance to allow of its being properly carried out.

MUSICAL INSTRUMENTS

Of the Burmese musical instruments, the chief in size and power, is called Patshaung, and may be styled a Drum Harmonicon. It consists of a circular tub-like frame, about thirty inches high and four feet six inches in diameter. This frame is formed of separate wooden staves fancifully carved, and fitting by tennon into a hoop which keeps them in place. Round the interior of the frame are suspended vertically some eighteen or twenty drums, or tom-toms, graduated in tone, and in size from about $2\frac{1}{2}$ inches diameter up to ten. In tuning, the tone of each drum is modified as required, by the application of a little moist clay with a sweep of the thumb, in the centre of the parchment. The whole system then forms a sort of harmonicon, on which the performer, squatted in the middle, plays with the natural plectra of his fingers and palms,—and with great dexterity and musical effect.

Another somewhat similar instrument has a frame about four feet in diameter, and fourteen inches high. The player sits within the inner circle and strikes the gongs with small drum-sticks. This instrument is one of singular sweetness and melody.

The harp of Burmah is held across the lap when played, the curved horn being to the left, and the right hand passed round and over the strings instead of being kept upright like the Welsh harp. Tasselled cords attached to the ends of the strings and twisted round the curved head, serve for tuning. This is done by pushing them up or down, so that the curvature of the head increases or diminishes the tension. These cords are at the same time ornamental appendages to the harp. This harp is a pleasing instrument by itself, but it is usually only an accompaniment to unmelodious chants of intolerable prolixity.

The bamboo Harmonicon or staccato is a musical instrument used throughout Burmah and the Eastern Archipelago. In Java they have a number of such instruments, made in wood and metal, and only slightly differing from one another, though distinguished by different names. In that of Burmah, eighteen to twenty slips of bamboo, about an inch and a half broad and of graduated length, are strung upon a double string, and suspended in a catenary over the mouth of a trough-like sounding box. The roundish side of the bamboo is uppermost, and whilst the extremities of the slips are left to their original thickness, the middle part of each is thinned and hollowed out below. The tuning is accomplished partly by the regulating of this thinning of the middle part. The scale so formed is played with one or two drum-

sticks, and the instrument is one of very mellow and pleasing tone. Though the materials are of no value, a good old Harmonicon is prized by the owner, like a good old Cienou, and he can rarely be induced to part with it.

The musical instruments of Java are the Bonang, Klomo and Gambang — *Tod's Rajasthan*, vol. 1 p. 539. *Native Public Opinion*. Herklot. *Yule's Mission*.

MUSICAL-FISH, or Drum-fish, a sea-fish near the Pearl river near Macao. Every evening, they assemble around a ship and continue their musical humming till about mid-night. The noise rises and falls or suddenly ceases at times as they quit the ship in search of food — *Adams*, p. 63.

MUSICANI, an ancient people of upper Sindh, whose capital was Aloī.

MUSICANUS, a chief mentioned in the account of the Voyage of Nearchus. Pottinger finds a similarity between Musicanus and Moo-Sehwan, the names of two contiguous districts in Sind, and usually connected in utterance. They lie exactly where we are told the Greeks found that chief's territories. From the territory of the Sogdi or Sodra, Alexander continued his voyage down the Indus to the capital of a king named Musikanus, according to Strabo, Diodorus, and Arrian or of a people named Musican, according to Curtius. These statements can only apply to the rich and powerful kingdom of Upper Sindh, of which Aloī is known to have been the capital for many ages. There is however nothing to guide us but the general description that the kingdom of Musikanus was "the richest and most populous throughout all India," and that the territory of Aloī was rich and fertile, is known from the early Arab geographers, who are unanimous in its praise. The ruins of Aloī are situated to the south of a gap in the low range of limestone-hills which stretches from Bukkur or Bhakar towards the south for about 20 miles, until it is lost in the broad belt of sand-hills which bound the Nāra, or old bed of the Indus on the west. Through this gap a branch of the Indus once flowed, which protected the city on the north-west. To the north-east it was covered by a second branch, of the river, which flowed nearly at right angles to the other, at a distance of three miles. At the recession of Raja Dahu, in A. D. 680, the latter was probably the main stream of the Indus which had been gradually working to the westward from its original bed in the old Nāra. According to the native histories, the final change was hastened by the excavation of a channel through the northern end of

the range of hills between Bhakar and Rori. The correct name of Aloī is not quite certain. The common pronunciation at present is Aloī, but General Cunningham thinks it probable that the original name was Rori, and that the initial vowel was derived from the Arabic prefix Al, as it is written Aloī in Biladūn, Edrisi, and other Arab authors. The city of Musikanus was evidently a position of some consequence as Arrian relates that Alexander "ordered Kiartens to build a castle in the city, and himself came there to see it finished." *Pottinger, Travels in Beloochistan, Asiatic Researches*, vol. 15 p. 14. *Cunningham Ancient Geography of India*, pp. 256, 259. See Kabul.

MUSINA, a little mammal of Japan, very like a racoon.

MUSINA, or musnee. **BENG. HIND.** Linnæi usitatissimum.

MUSIRIS. A port known to the Greeks on the coast of Malabar, in all probability, Mangalore. It is alluded to in the Periplus of the Erythrean Sea (supposed to have been written by Arrian) to whom we are indebted for the earliest mention of the peninsula of the Dekhan, and we are informed of Hippalus, the commander of a vessel in the Indian trade, having the hardihood to stretch out to sea, from the mouth of the Arabian gulf and practically test the more theoretical observations of his predecessors. This experiment was successful, and he found himself carried by the south-west monsoon to Musiris. This bold adventure, gained for him the honour of having his name attached to the wind by which he was enabled to perform this novel voyage — *Ind. in 15th Century*.

MUSJID, **AR.** a mosque. Musjid-ul-Haram, the sacred or inviolable temple, i. e., Kaaba. The English letter j amongst the people of Egypt and Turkey, has the hard sound of g, hence musjid is pronounced musgid, from which is the English word mosque.

Musk is a secretion in the preputial follicles of the musk deer, the Moschus moschiferus, and is sometimes adulterated with dried blood or catechu. If the former

MUSK

be present, agitation with distilled water will often form a solution, coagulated by heat. The latter is detected by adding a solution of minute of iron to the water in which the musk was diffused: a deep black colour is produced if catechu be present. Globules of lead are often fraudulently introduced into the sacs, the best test is the strength of the alcoholic solution. The Musk deer is found in the Himalaya, Siberia, Tonquin, and Cochinchina. A substance analogous to musk (in Hyacinth) is brought to Bombay by merchants from Zanzibar. True musk is only found in the follicle of the musk deer, in the rutting season and in the early winter. Good musk is in irregular unctuous, light, dry, reddish-black, or dark purple grains, concreted in a slightly oval bag, about $1\frac{1}{2}$ inches in diameter, hairy on one side and not on the other, they weigh from 200 to 250 grains a piece. The small dark bags with the grayish hairs arranged evenly round the centre are the best. In the living animal the musk has the consistence of honey, is of a brownish-red color, and has a strong odour. When dry, the musk is almost solid, granular, and of a dark-brown color. It feels unctuous and fatty, has a bitter aromatic taste and its smell is powerful. Each sac does not contain more than 370 grains in an adult, and 123 in an old animal. Two kinds of musk are known in commerce, the Tonquin, or Chinese, which is the best, and the Habardui, or Russian. The musk that reaches Britain is imported from China in chests of from 60 to 100 ounces each. An inferior kind, of hill produce is imported from Bengal. There is also a Siberian or Russian musk. The Chinese musk bags are always observed to have been opened and sewn up again, and it is probable that adulteration is largely practised: the blood of the animal is often mixed with the musk. The Simla musk balls, which are presented as complimentary razars by hill chiefs, are an inferior kind, and do not command anything like the price of the genuine Tibet balls. About 100 musk bags are imported from Changthan via Yarkand of which about 40 go to Yarkand the rest go to Kashmir and Jammu, and are taken by Yarkandi pilgrims to Mecca for sale in India or other Asiatic countries: they are produced in the north-west of Rodokh and Nepal, and their value, at Le, 7 to 15 Rs, but all supply from that quarter has long ceased. In 1857, the import of musk into England was 10,728 ounces. The pod is obtained from the male, the largest are the size of about a pullet's egg and worth about 25

MUSK-DEER

shillings. Edrisi, the Moorish geographer, writing in the twelfth century, enumerates musk as one of the productions then exported from Ceylon, but this must have been the civet of the glossy genet, the civet cat of Europeans, which is common in the northern province, where the Tanul people confine it in cages for the sake of its musk, which they collect from the wooden bars on which it rubs itself. The musk bag of the musk deer consists of a sac, which is only present in the male, it is placed on the median line of the abdomen, between the navel and the outlet of the prepuce and near the latter. The sac is of a rounded oval form, flat on its superior and adherent surface, but convex and covered with hair on its inferior or free surface. In adults the sac is from two to three inches long, and 7 to 10 lines in depth. The envelope of the sac consists of three separate membranes. These small bodies are glands for the secretion of the musk. Toward the middle of the external surface of the sac is a short canal, which passes obliquely, and has its internal opening marked by a number of converging hairs.—O'Shaughnessy

MUSK-DEER

Moschus moschiferus | Ronz, The
Lig Liba or Lay, Trib

The musk-deer, is about the size of a young roebuck six months old. The color of the skin is blackish with a mixture of yellow and reddish brown. The tail has a heart-shaped space around it, naked in the male and always moistened with a strong smelling secretion, the females, during the whole of life, and the males up to two years of age, have the tail covered with hair on its upper part, and with wool on its under part: the animal has no horns. It is timid and nocturnal in its habits, very rapid in its course, it has a leaping motion, something like that of the hare, it leads a solitary life, except in autumn, it feeds upon the leaves, bark, and roots of trees, its flesh is good to eat. The male animal produces the musk, it is a native of Eastern Asia, between the 30° and 60° north latitude. It is found in the steppes of the Altai on the Irtysh river, extending eastward as far as the river Yenesei and lake Bukal.

The musk-deer is rather more than three feet long, and stands nearly two feet high at the shoulder, but they vary considerably in size, those found in thick shady woods being invariably larger than those on rocky open ground. The head is small, the ears long and erect. The male has a tusk depending from each upper jaw, which, in a full-grown animal is about three inches long, the thickness of a goose-quill, sharp pointed, and curving

slightly backwards. The general colour is a dark speckled brownish gray, deepening to nearly black on the hind quarters, where it is edged down the inside of the thighs with reddish yellow. The throat, belly, and legs, are of a lighter gray. Legs long and slender, toes long and pointed, the hind heels are long, and as well as the toes rest on the ground. The fur is composed of thick spiral hairs, not unlike muskrat porcupine quills, they are very brittle, breaking with a slight pull, and so thickly set, that numbers may be pulled out without altering the outward appearance of the fur. It is white from the roots to nearly the tips, where it gradually becomes dark. The fur is much longer and thicker on the hind parts than on the fore, and gives the animal the appearance of being much larger in the hind quarters, than the shoulder. The tail which is not seen unless the fur is parted, is an inch long, and about the thickness of a thumb, in females and young animals it is covered with hair, but in adult males is quite naked, except a slight tuft at the end, and often covered, as well as all the parts near it, with a yellowish waxy substance. The musk, which is much better known than the deer itself, is only found in adult males, the females have none, neither has any portion of them bores the slightest odour of musk. The dung of the males smells nearly as strong as musk, but singularly enough neither in the contents of the stomach, nor bladder, nor in any other part of the body, is there any perceptible scent of musk. The pod, which is placed near the navel, and between the flesh and the skin, is composed of several layers of thin skin, in which the musk is confined, and has much the appearance of the crop or stomach of a partridge, or other small gallinaceous bird, when full of food. There is an orifice outwards through the skin, into which, by a slight pressure, the finger will pass, but it has no connection whatever with the body. It is probable that musk is at times discharged through this orifice, as the pod is often found not half full, and sometimes even nearly void. The musk itself is in grains, from the size of a small bullet to a small shot, of irregular shape, but generally round or oblong, together with more or less in coarse powder. When fresh it is of a dark reddish brown colour, but when taken out of the pod and kept for any length of time, becomes nearly black. In autumn and winter the grains are firm, hard, and nearly dry, but in summer they become damp and soft. The musk-deer may be found upon every hill of an elevation above 8,000 feet, which is clothed with

forest. On the lower ranges it is comparatively a rare animal. Exclusively a forest animal, it inhabits all kinds of forest indiscriminately, from the oaks of the lower hills to the stunted bushes near the limits of vegetation the preference seems to be given to the brick forests, where the underwood consists chiefly of the white rhododendron and juniper.

The annual exports of musk from India were as under

1857-58	£ 1,950	1859-60	£ 1,792
1858-59	.., 3,230	1860-61	.., 3,671

Nearly all of it was from Bengal, none from Madras, and in these four years only to the value of £132 from Bombay. A white musk deer is said to have been brought from Banka, of the size of a kitten, white all over, and apparently full grown — *Markham's Shooting in the Himalayas*, p. 85-90. *O'Shaughnessy's Bengal Dispensary*, *O'Shaughnessy's Bengal Pharmacopoeia*, *Smith's Chinese Materia Medica*, p. 153. *Royle's Materia Medica Himala*, p. 269. *Cat. A fine cotton fabric, extensively manufactured in India, in Europe and America. There are a great variety of kinds and qualities, as, book-muslin, cambic-muslin, mull-muslin, &c. Formerly all muslins were made in British India, and Dacca in Bengal and Ainee in Chingleput were celebrated, Dacca, especially, was formerly celebrated for "its webs of woven wind." The Dacca muslin manufacture once employed thousands of hands, but towards the middle of the 19th Century it was quite at an end, so that it was with great difficulty that the specimens of the fabrics sent to the Great Exhibition of 1851, were procured. The kind of cotton (which is very short in the staple) employed, was hardly grown, and scarcely a loom then existed which was fit for the the finest fabrics. The Dacca

jewellers still excel in gold and silver filigree. At the Madras Exhibition of 1855, the Cambic muslin bleached and the Isree muslin exhibited by Veerabamma Kristnana Chetty were of a very superior quality and the Jury considered the manufacturer entitled to a reward of a 2nd class medal. The most celebrated of Indian muslins was that of Dacca, made from cotton grown in the vicinity, the thread from which does not swell. Chicacole, and Upada a few miles north of Cocanada formerly produced fine muslins and, in 1862, a strong muslin, generally checked, is procurable at Chicacole, at 3 to 6 rupees per piece of 8 yards, or made to order of very good quality at 11 rupees the piece. The famous Ainee muslins, of which Book muslins are an imitation prepared at Ainee in the Chingleput district they sell according to quality. At the 1851 and 1862 Exhibitions, Dacca muslins stood successful in comparison with those of Europe, and in the Industrial museum at London is a piece 20 yards X 1 yard, weighing only 7½ oz. At that of 1862, an excellent specimen of Dacca manufacture was superior to any shown in 1851, the best specimen on that occasion proving to be of No 357s yarn and that of 1862 389s. As then, however, some machine made muslin in the Exhibition was superior in point of fineness, according to the mode of computation adopted, there were exhibited also,

Charkina muslin	Ab iowan
Junglekhassa	Sircar i-Ah

Red spotted muslin, or	lity,
Boote	Maderpak muslin, from
Jamdanee	North Arcot

The thread used in weaving muslin of the finest kind is spun from a peculiar kind of cotton, known by the vernacular name of 'Pu Parthi'. The weavers state that they purchase this thread ready spun from a colony of pariahs, who have settled in the neighbourhood, and who have the speciality of its preparation. It is not stated wherein this peculiarity of manufacture chiefly consists, as all that the local report says on this head is, that after the cotton is carefully cleaned and picked it is laid by in cloth bundles for two or three years, when it is rolled in plantain bark and then wound off. The weavers of the Philippines succeed in reducing the harsh filaments of the Abaca palm-tree, to such a degree of fineness, that they afterwards convert them into textures equal to the best muslins of Bengal.

of the exceedingly fine musktoes slowly drying out. There is a demand for those of the finest quality—the broad or running-vein and the narrow-vein. The Native nobility do not prize the finest sort, and there is no market for them elsewhere. In 1862, there was only a single pair of weavers in Dacca who could manufacture the very finest quality, and it takes them six months to make up one piece, but even for this piece they can no orders. Besides, the particular kind of cotton, known, supposed to be finer than the best new Orleans staple, from which alone the thread was spun, is now never grown. The principal varieties of plain musktoes manufactured at Dacca, are Mulinul Khis, Abirwan, Shab-nam, Khasa, Jhuma, Chon Ali Tan-zab, Alabullee Nysook, Buddan Khis, Turandim, Sambutee and Surbund—names which denote fineness, beauty or transparency of texture, or the uses to which they are put. *Hooker Himal Jour* vol. ii p. 251 *Rhodes, MSS M E J R* *Wotton's State* p. 55-6 *Cut Erh* 1862

MUSKITO

Engl,	HIND	Kosh,	Tam
Muskito, agas,	Mala	Domr,	Tam
	"		

Some writers have supposed the muskitoes to be the flies alluded to in Scripture, sent as plagues, but Bruce thought this Egyptian plague might be the Bimb of Abyssinia, and this is probably correct. Four species are known, *Culex lugens*, *C. fuscans*, *C. cinereolens* and *C. regius* a few sprigs of worm-wood placed about the pillow, will protect the sleeper from their attacks or rub the worm-wood gently over the forehead and wrists, the last thing at night, and the muskitoes or other insects will give annoyance. These insects are most abundant near stagnant water and the great rivers. Along the banks of the Nile they are very common

sleeps under a musquito curtain the insects are so numerous. Their passage from a river or tank is intercepted by trees and at Kimmendine myriads hang about the trees. Captain Elphinstone Eiskine also mentions that whenever the muskitoes were uncommonly numerous in Rewa (which was five miles from Ninque), he always used to be told that the boys had been disturbing the akan mnam. This tree was completely covered with muskitoes, and so thick were they, that one could easily have taken a cupful from any branch at one scoop. Every part of the tree, from the very top to the root, and in the same manner the branches, appeared to be one solid trunk composed of muskitoes. He was told by Thakonau that it had been so that since he was a boy, that it was the property of the tree to attract the muskitoes, and that, if never disturbed, the country would be entirely free from these troublesome insects. In India they are smoked out of a room by burning chips of wood. Various substances are employed by the Chinese to drive them away. On boardmen, says Fortune, who heard him talking about the musquito, asked Sing-Hoo why he did not buy some musquito tobacco, which they said might be had in the village, and which would drive all the muskitoes out of the boat. Immediately, he says, I despatched him to procure some of this invaluable substance. In a few minutes he returned with four long sticks in his hand, not unlike the pastilles commonly used for burning incense in the temples, only somewhat longer and coarser in appearance. They cost only two cash each—made with the sawings of resinous woods—procured, he supposes, from juniper-trees—and mixed with some combustible matter to make it burn. A piece of split bamboo, three or four feet in length, is then covered all over with this substance. When finished it is as thick as a rattan or a small cane. The upper end of the bamboo has a slit in it for looking on to any nail in the wall, or to the roof of a boat. When once lighted, it goes on burning upwards until within six inches of the hook, beyond which there is no combustible matter, and it then dies out. A somewhat fragrant smell is given out during combustion, which at a distance, is not disagreeable. Sometimes the sawdust is put up in coils of paper, and is then burned on the floors of the houses. Various species of wormwood are likewise employed for the same purpose. The stems and leaves of these plants are twisted and dried, and probably dipped in some preparation to make them burn. The musquito

has a mortal aversion to all these substances and wherever they are burning, there the little tormentors will not come. I procured, he adds, the sticks in question, and burnt them daily, after this, and although the insects were often swarming when I entered the boat or an inn, the moment then "torreco" was lighted they quickly disappeared, and left me to sit at my ease, or to enjoy refreshing sleep. A person informed him that they used the sawings of juniper or pine trees (pih heang fun, or sang shoo), mimosa-leaves reduced to powder (mu-hin) tobacco leaves (ein fun), a small portion of arsenic (pe zu), and a mineral called mu-wang. To thirty pounds of the pine or juniper sawings, about twenty of mimosa, five of tobacco, and a small quantity of arsenic were added. From subsequent inquiries, he ascertained the composition to be pine and juniper sawings, wormwood leaves, and tobacco-leaves, reduced to powder, a small portion of mu-wang and arsenic. Each article was well beaten up with water, then the whole mixed together, and in the form of a thick paste rolled on a slip of bamboo. On exposure to the sun the substance dried gradually, and was then put away for sale. When finished the sticks are somewhat like the common joss-sticks of the country, or about the thickness and length of a light walking cane. Another substance, much cheaper than the first, is found in every town and village in the central and eastern provinces of the empire, but no doubt it is in use over the greater part of China. Long narrow bags of paper—say half an inch in diameter and two feet long—are filled with the following substances, namely, the sawings of pine or juniper mixed with a small portion of mu-wang and arsenic. The proportions are thirty pounds of sawings, two ounces of mu-wang, and one ounce of arsenic. This mixture is not made up in the form of a paste like the latter but simply well mixed, and then run into the bags in a dry state. Each bag being filled is closed at the mouth, and then coiled up like a rope and fastened in this position with a bit of thread. Many hundreds of these coils neatly done up and placed one above another, may be seen exposed for sale in shops during the hot season, when musquitos are numerous — *Davies' Chinese, Algiers in 1857, p 15* *Capt Elphinstone Eschne, Islands of the Western Pacific, p 469* *Fortune's Tea Districts, p 180*, *A Residence among the Chinese p 111* See Mosquito

MUSSOORIE or Masuri, a sanatorium or hill station, in the Himalaya, which adjoins Landon on the west and consists of a series of ridges about 5 miles in extent running off almost east and west with frequent peaks, and with spurs or shoulders issuing irregularly down to the valley of Deyali Dhoon on the south, and to the river Uglai or Uggulwar on the north, with deep wooded gorges between Banog, a hill to the west of the settlement has been ascertained to be 7,545 feet above the level of the sea and to be in 30° 28' 29" N lat and 78° 32' 3" E long. The river Jumna flows around the northern face of Banog and Badiay bounds the settlement of Mussoorie on the west. Mussoorie was first resorted to as a sanatorium in 1823. It is built upon heights varying from 6,400 to 7,200 feet, the majority of houses being situated at probably the mean elevation of 6,800 feet. There is no table land of any extent and almost every building stands on a site, which it was necessary to level either on a peak or ridge, on the southern slope of the mountains. There are few houses on the northern face. The buildings are generally a considerable distance apart, but they are closer together towards the east and in the centre than towards the west, which is the direction in which the settlement is extending. The view of the snowy mountains to the north, (which on a clear day appears to be within a few hours journey) and of the beautiful valley of the Dhoon, spread out like a painted map at the foot of the hills to the south, has been greatly admired. The river Ganges and Jumna are visible from many parts of Mussoorie not only as they foam over their rocky beds in their impetuous race through the valley but stretching far away into the plains. The sta-

MUSSULMAN

tion of Sabarunpore is also to be distinguished with a glass, bounding the horizon over the Sawalik range of hills which shuts in the valley of the Dhoon to the south. Comparisons have been made between Simla and Mussoorie to the disadvantage of the latter on account of the nakedness of the hills, or at least the want of forest trees, and particularly of the deodar which gives such a peculiar character to the scenery, at the first mentioned station. In January and February the weather is wintry always with frost more or less intense, and occasional falls of snow. In the course of March the frost entirely disappears, and many trees put forth their new leaves. Showers of rain, and sometimes of hail with thunder storms are experienced in this month and in April, after which till the setting in of the rains in the middle of June there is generally settled summer weather. The rains are considerably heavier than at the neighbouring stations of the plains. They cease on or before the 18th of September and are succeeded by a beautiful agreeable season, which lasts till Christmas, and sometimes till the middle or end of January. In this period of the year scarcely a closed door is to be seen and the temperature gradually sinks from 64° in the shade, in the beginning of October into that of sharp winter, the frost becoming strong in the course of November. The temperature of a spring on the north face of Mussoorie is nearly 54½° which may be assumed to be the mean temperature of the place and the mean extreme daily range (as determined by a thermometer in an open north verandah in March 1838), the most variable month of the year, was less than 5½°. Mussoorie is found to be 20° to 25° degrees cooler than the neighbouring stations.

MUSSOOR PURPOO, TAM *Ervum lens*.

MUSSUCK, or mushak HIND inflated skins, generally of bullocks and goats, used for carrying water.

MUSSULMAN, AR properly muslim, a person of the mahomedan religion, it is the plural form of the Arabic muslim. A woman is called muslimah and the creed Islam. There are, in British India, about seventeen millions of this faith, principally of Arab, Persian and Moghul descent, with many converts, however, particularly in lower eastern Bengal. They are of two sects, sunni and shiah Arabia, Persia, Asiatic Turkey, Central Asia, Egypt and Afghanistan, are largely mahomedan or mussulman. In European Turkey the mahomedans form about a sixth part of the population. The Afghans are mussulmans of the sunni sect with the

exception of the tribe of Beritchee, who belong to that of the shiuh. The Parsivan and Lemak, who are subject to the Afghans, equally, profess the faith of Islam but besides the two just mentioned some of them are of a third called Ah Illidze. The mussalmans or mahomedians are very numerous one of them is the Wihabi. Derayah the Wihabi chief, is situated on the Wadi Beir Hattah, one of the defiles by which alone the Nijef-el-And can be entered. The Wihabi chief, himself a Mu'ahhid, or Unitarian, in opposition to Musluk—Polytheism—in other sects but his own, and in Meccah follows out his two principal tenets, public prayer ten times daily. The founder of this religion was Abdul Wahab a native of Arree a town in the district of El Aree. This man, in his youth, first studied at home the sciences which are chiefly cultivated in Arabia, he afterwards spent some time at Berr, and made several journeys to Bagdad, and through Persia. After having reached his native place, he began to propagate his opinions among his countrymen, and succeeded in converting several of them. Soon, whose subjects consequently, became followers of this leader. —*Journal of the Asiatic Society*, p 291 *Journal of the Asiatic Society*, vol 1 p 5 *Journal of the Asiatic Society*, vol 1 p 5 *Journal of the Asiatic Society*, vol 1 p 5 *Journal of the Asiatic Society*, vol 1 p 5

MUSTANG See Bungolzye, Kelat

MUSTARD, of commerce, is of a light yellow color. The seeds of both black and white mustard are first crushed between rollers, and then pounded in mortars. The pounded seeds are then sifted. The residue in the sieve is called dressings, or siftings, what passes through is impure flour of mustard. The latter by a second sifting, yields pure flour of mustard, and a second quantity of dressings by pressure, the dressings yield a fixed oil which is used for mixing with rape and other oils. Immense quantities of wheaten flour are employed in the adulteration of mustard, and many samples almost entirely consist of it. Pearl-flour is sometimes used. Out of fifty samples of mustard which Dr. Hassall submitted to examination he had not met with a single instance of adulteration with any other grain than wheaten flour. Genuine mustard, whatever be the price paid for it, is scarcely ever to be obtained, forty-two samples submitted to examination were all found adulterated, the adulteration practised, in every case, was the same in kind, varying only in degree, and consisted in the admixture of genuine mustard with immense quantities of wheaten flour, highly colored with turmeric. Turmeric powder is the ground tuber of *Curcuma longa* one of the Zingiberaceae, it is of a dark yellow color and consists of large cells, some of these are loosely imbedded in a reticular tissue, but others, and these the majority, are quite free they may be recognised with facility under the microscope by their size and bright yellow color. Although Dr. Hassall examined a large number of samples of mustard in no instance did he find turmeric powder absent. By some means or other probably by moisture and heat the turmeric powder is made to part with a portion of its coloring-matter to the flour which enters so largely into the composition of the mustard of the shops. Four qualities of mustard are supplied by the manufacturer. The first is called "second" it is usually of a bright yellow color, but is thickly studded over with numerous black or reddish-black points these are fragments of the husks of black mustard seeds. The next

MUSTARD OIL

quality is termed "fine," it also presents a considerable number of black specks, but fewer than in the former case. The third quality is called "superfine," it is spotted to a much less extent, although minute specks are still visible. The fourth, or best quality, is the "double-superfine," in this the eye can scarcely detect husk at all, although with the microscope, a little may still be discovered. These several qualities are vended to the public by a wholesale and retail establishment in the city of London at the following rates: "seconds," 5*d*, "fine," 8*d*, "superfine," 11*d*, "double-superfine," 1*s* 2*d*, per lb. The qualities of samples varied much—from "second" to "double-superfine." The price also varied greatly—from 1*s* to 2*s* the pound, the ordinary charge made being 1*s* and 1*s* 4*d* the pound.—*Hassall, Food and its Adulteration*, p. 123. See *Sinapis*.

The black mustard is indigenous in almost every part of Europe and S Asia, its seeds are small and roundish, externally they are beautifully veined, and of a reddish or blackish brown colour, though sometimes whitish. Internally they are yellow. They are odorless, but have an acid oleaginous taste.—*Perena*.

MUSTARD SEED, White

MUSTELIDÆ

Mustard oil is expressed in various parts of India from the seeds of different species of *sinapis*, especially from the black mustard seed *S. glauca*, *S. bichotoma*, and *S. juncea*, are also extensively cultivated in the east for their oil, and *S. alba*, *S. arvensis*, *S. nigra* are also grown. The oil, as prepared from the seeds of different species of *sinapis*, is used in the northern parts of Hindustan, and in many parts of Malabar, for culinary purposes, in the same way as butter and ghee is on the Coromandel Coast. Mustard oil has of late been exported from Bombay to England and France. Five or six species of *sinapis* are cultivated in all parts of India, for the sake of the valuable oil they yield. Those most frequently seen are *S. glauca*, *S. toria* and *S. racemosa*. The seeds of the "*Sinapis alba*" yield by expression 36 per cent of a bright yellow, pleasant tasted, edible oil, having a strong smell, and slight taste of mustard. The seeds of "*Sinapis nigra*," yield only 28 per cent of an oil in all respects similar to the above. The average price of mustard seed in eighteen large stations, in all parts of the Madras Presidency, for the quarter ending 31st October 1854, was Rs 1-2-8 per maund of 25lbs, the maximum being Rs 1-11-6 at Cannanore, and the minimum As. 10-5 at Nagpore. In Vizagapatam it costs Rs 208 per sicca garce. The oil is not exported from Madras, but the seeds have been shipped as follows:

1847-48	Cwt 5,828	1850-51	Cwt. 9,909
1848-49	" 6,767	1851-52	" 3,636
1849-50	" 9,435	1852-53...	" 16,075

It is used in most parts of India in cookery, and is considered superior to all other oils for anointing the body, which it is supposed to invigorate. In medicine, it is sometimes given internally, but is more frequently applied as a rubefacient.—*Amstie Materia Indica, Faulkner Commercial Dictionary, Madras Exhibition Jones Reports*.

name of the *Ficus Benjamin* tree, which always adorns the open plain in front of the houses of Javanese chiefs. Amulets, are, however, worn by almost all eastern nations. They are especially prized by mahomedans, of whom both young and old wear them. They are usually put on the young to ward off disease and to guard from the evil eye, and consist of figures with numbers on pieces of paper, or Arabic words, often extracts from the Koran, engraved on pot stone or silver or gold and worn from the neck. They are also put over the door porch or on the house wall—*Journal of the Indian Archipelago*, No VI—XII June—December 1853, p 274. Sec Charm, Nadoli.

MUSTUNG has a healthy climate and fertile soil. It contains no Afghans, the fixed inhabitants are Dehwai, mixed with the Raisani, Sherwani, Mahomed Shahi, Bangul-zye, Lari, and Supheria tribes of Giahui. The Bangul-zye exclusively occupy Ispringi, but reside also at Shall and Mustung and in winter repair to Tahi near Lehui.

MUTHURA, BENG *Callicarpa incana*

MUTHURA, Muttia or Mathura, a holy city of India, one of the most ancient places in Hindusthan. It is famous in the history of Krishna, as the stronghold of his enemy Raja Kaasa, and it is noticed by Arrian,

on the authority of Megasthenes as the capital of the Suraseni. Surasena was the grand father of Krishna, and from him Krishna and his descendants, who held Muthura after the death of Kansa, were called the Suraseni. According to Arrian, the Suraseni possessed two great cities, Methoras and Khisoboras, and the navigable river Jomares flowed through their territories. Ptolemy names the river Jomares, that is, the Jumna, and says that it passed between the towns of Methora and Khisobora. Ptolemy mentions only Muthura, under the form of Modura, Μαθουρα, to which he adds *ἡ τῶν θεῶν*, that is "the city of the gods," or holy city. In the seventh century the famous city of Muthura was the capital of a large kingdom, which is said to have been 5,000 li, or 833 miles, in extent. If this estimate be correct, the province must have included not only the whole of the country lying between the districts of Bhat and Agra, but a still larger tract beyond Agra, as far as Nowar and Siopuri on the south, and the Sindhu river on the east. Within these limits the circuit of the province is 650 miles measured direct, or upwards of 750 miles by road distance. It includes the present district of Mathura, with the small states of Bhmatpur, Kharoli and Dholpur, and the northern half of the Gwalior territory. To the east it would have been bounded by the kingdom of Jyotsna, and on the south by Malwa, both of which are described by Hwen Thsang as separate kingdoms. The city is surrounded by numbers of high mounds, several of which are no doubt old brick kilns, but many of them are the remains of extensive buildings, which having been dug over for ages in search of bricks, are now mere heaps of brick dust and broken brick. Taking Muthura as a centre the circle described by a radius of eighty-four miles would give the extent of ancient Viji, the seat of all that was refined in hindooism and the language of which, Viji-boli, was the purest and the most melodious dialect of India. In all Viji, the most classic spot is Bindabun. As the birth place of Krishna, Muthura is as sacred to the Vishnuvites as Bethlehem is to the Christians. A Dwapa prince had overthrown the Sena dynasty and re-established the aboriginal domination at Muthura. But Krishna was born in August, during the height of the rains. The most sacred spot in all Muthura is the Bismaghant, where Krishna and Buldeo rested from their labours of slaying Kansa, and digging his corpse to the river side. In Hwen Thsang's time there were only five brahminical temples in Muthura—in the

middle of the nineteenth century, there was only one Jain temple in Bindabun. Fa Hian and his companions halted at Muthura for a whole month during which time the clergy held a great assembly and discoursed upon the law. After the meeting they proceeded to the stupa of Sainpura, to which they made an offering of all sorts of perfumes, and before which they kept lamps burning the whole night. In Hwen Thsang's time the number of towers and monasteries was the same, but that of the monks had been reduced to 2,000. The king and his ministers were all zealous buddhists. In the Bismaghant is annually held a great barbing mela, or assembly, called Jumna-ki-Boorkee, on which occasion the gathering of men from Behar, Bundelund and other remote parts of India exceeds more than a hundred thousand. To the Chowbay race, the occasion proves a great harvest of gain. The pittances offered to the images of Krishna and Buldeo at the ghant sometimes amount to thirty or forty thousand rupees. The Greeks saw the Hindoos worship Bacchus in ancient Methora. This may possibly refer to, 'the curious Greek-clad statue,' which, with his portly carcass, drunken lassitude, and wine-wearied forehead, is considered by the antiquarians to be the 'well-known figure of the wine-bibbing Silenus.' The statue was discovered along with a Bacchic altar in 1836. It does not appear probable to have been worshipped by the buddhist or hindoo of olden time, and the way in which the question of its presence can most reasonably be solved, is to assume the residence of a body of Bactrian Greek sculptors who found employment for their services amongst the tolerant buddhists of the great city of Muthura, about the beginning of the christian era. Long has any buddhist or Greek god ceased to be worshipped in Muthura. The most favourite local deity now is Krishna, who is adored in nearly all the temples, abounding in the town which owns his exclusive jurisdiction. Contiguous to Muthura are those great sandstone quarries which for ages have furnished materials to the architects of Upper India for building the houses, shops, temples, and ghants of its principle cities. In Muthura, the ghants are light and graceful, in Benares, they are severe and simple. Buddhism in one shape or another, seems to have always existed in Muthura maintaining its ground under the modified form of Jainism, after the votaries of Sakya Muni had lost their footing.—*Cunningham's Ancient Geography of India*, p 373, 374. *The Hind* vol II p 22-44. See Viji.

MUTILLA ANTIGUENSIS Linn Mutilla occidentalis, Bee botch, is a most beautiful scarlet velvet colored insect, about the size of a large pea, commonly found in rainy weather, throughout British India These insects are officinal, and are kept by the druggists The native doctors use them against snake-bites, and in colic of horses — *Hornbaker*, p 514

MUTILLIDÆ, a genus of insects of the order Hymenoptera, comprising two genera Mutilla, and Tiphia

MUTINY, has occurred amongst the British Indian Army on several occasions In June 1764, the sepoys in the service of the E I Company mutined for an increase of pay and bhatta, but Major Munro quelled the mutiny by blowing many away from guns In January 1766, the double bhatta was abolished It had been granted to the E I Company's Army by Mr Jaffin in gratitude for their services But on its abolition both officers and men mutined, and it was only put down in fifteen days by the severe measures which Clive adopted In 1795, the Bengal officers broke out into open rebellion Its cause was Lord Cornwallis' abolition of all offices of gain in the military branch of the service The revolt was settled by the concession which Sir John Shore made to them Disaffection sprung up amongst the European officers of the Madras Army, in the early part of the nineteenth century, with whom a few regiments of sepoys sympathized, but it was quickly subdued About the year 1824 at Bariackpore disaffection was again manifested In 1857 the greater part of the army of Bengal and several Regiments of the Bombay Army revolted The first signs occurred near Calcutta but the revolt continued by the outbreak of the native cavalry at Meerut, on the 10th May 1857, and before the end of

MUTTALLA

1857 nearly all the Bengal Army, with several regiments were swept away, but before this could be done, many of the predatory tribes and numbers of the civil population engaged in the rising, and a rebellion of nearly all Upper India was the result The Sikhs of the Punjab greatly aided in re-subduing the populations Disaffection occurred amongst the European soldiers of the E I Company's Army, on the 2nd May 1859 which resulted in about 10,000 soldiers taking their discharge

MYURA Hwen Thsang describes the town of Mo-yu-lo, or Mayura, as situated on the north-west frontier of Madawar, and on the eastern bank of the Ganges. The vicinity of Ganga-dwara, or the Ganges gate, which was the old name of Haridwar or Gate of Hari, shows that Mayura must be the present ruined site of Mayapura, at the head of the Ganges canal. But both of these places are now on the western bank of the Ganges, instead of on the eastern bank, as stated by Hwen Thsang. The name of Haridwara, or "Vishnu's Gate," would appear to be comparatively modern, as both Abu Rihan and Rashid-ud-din mention only Ganga-dwara. Kalidas, also, in his *Meghaduta*, says nothing of Haridwara, although he mentions Kankhal, but as his contemporary Amarasinha gives Vishnupada as one of the synonyms of the Ganges, it is

MYCTERIA AUSTRALIS

certain that the legend of its use from Vishnu's foot is as old as the fifth century—*Cunningham's Ancient Geography of India*, pp 351-353. See Ganges, Gangotri

MYAS HORMUS Gibbon says every year about the summer solstice, a fleet of 120 vessels sailed from Myas Hormus, a port of Egypt on the Red Sea. The coast of Malabar, or the Island of Ceylon, was the usual limit of their navigation, and it was in those markets that the merchants from the more remote parts of Asia expected their arrival. Mr Gibbins has pointed out that in classical days the extremity of the peninsula was the entrepot of commerce between the east and the west.

MYEN-MO BURM In Burmese cosmology, the great mountain, Maha-Mein, surrounded by its seven concentric and graduated rings in the centre of this Sakwala or Mammue system, which again is encompassed by a circular wall of rock called the Sakwalingit. One of the Burmese legends, at the termination of them Wat or Lent, is called Tse-mue-myen-mo, or Myen-mo lamp lights. The streets are illuminated and in them are exhibited high round structures, to represent Mount Myen-mo covered with little figures of its spiritual inhabitants. This enormous central mountain is several millions of miles high, round which, according to the Burmese theory of the solar system, are firmly fixed four great islands, on the southern of which Asia and Europe are situated, the sun which lights them revolving round the central mountain. Mount Myen-mo mountain forms the centre of the Sakwala or Sakha system of cosmogony. One of the four great islands which surround it is Jambudipa, the world we live in — *Yule*, p. 172

MYE WOTE, BURM A goat-sucker? a snipe?

MYFORE See India

MYGALE AVICULARIA, builds a strong white web and Mr Butes found two females involved in it, one dead, the other dying. Madame Merlan, in a work on the insects of Sumatra, published in 1705, figured the *Mygale avicularia*, in the act of devouring a humming bird. The accuracy of her statement has since been impugned by a correspondent of the Zoological Society of London — *Eub's Nat on the Animals*, vol. 1, p. 161

MYGALE FASCIATA, a Ceylon spider, the limbs of which, when expanded, have a diameter of 6 to 8 inches. By day, it remains concealed in its den, whence it issues at night to feed on larvae and worms, cockroaches and then pupa, its food consisting of soft insects and annelides. It makes its nest in walls, trees, or sheltered by stones. It is lined throughout with a tubular silk tapestry, so fine and closely woven as to be water-tight, and at its mouth is a little platform stayed by braces. In the rainy

MYLABRIS

season the platform is extended so as to form an awning. The *Mygale fasciata* is not only sluggish in its habits, but disgusting in its form and dimensions. Its colour is a gloomy brown, interrupted by irregular blotches and faint bands (whence its name), it is sparingly sprinkled with hairs, and its limbs, when expanded stretch over an area, of 6 to 8 inches in diameter. It is familiar to Europeans in Ceylon, who have given it the name, and ascribed to it the fabulous propensities of the tarantula. This hideous creature does not weave a broad web or skin, a net like other spiders but nevertheless, it forms a comfortable mansion in the wall of a neglected building, the hollow of a tree, or under the eave of an overhanging stone — *Tennent's Sketches of the Nat Hist of Ceylon* p. 465 to 467

MYGALE MOSCHATA See *Soricidae*

MYIEE a pass in Annam is in lat 19° 14', long 94, 30' Myhee village is a police station

MYHERE This state was originally a dependency of Rewah. On the occupation of Bundelcund, thakoor Doojun Sing was confirmed in his possession on his executing a deed of allegiance. The area of Myhere is about 400 square miles, the population 70,000 and the revenue Rs 74,200

MYHILENAH T'AM Mylelu, MALAY A Malabar and Canara wood of a greenish tinge, and very close grained, it grows to about twelve or fifteen feet long, and two and a half feet in diameter. It produces a fruit like green pepper, its leaves resemble the mango. The wood is generally considered strong and durable, and the native carpenters procure from its branches the small crooks for the knees and timbers of boats, &c, and the large limbs for the frames of native vessels. The tree is scarce in the north part of Malabar and Canara, and not known in Ceylon — *Edge, Forests of Malabar and Canara*

MYLABRIS, a genus of insects of the order Coleoptera, possessing properties identical with those of the blistering beetle *Cantharis vesicatoria*. The ancients chiefly employed two species of *Mylabris*, one of which, the *M. cichorii*, the telum of the hindoos, has been used for ages, and is so at present by the European and native physicians of India and China. The blistering flies of India are chiefly the *Mylabris* or *Meloe cichorii*, the *Cantharis gigas*, and the *Cantharis violacea*

MYLABRIS

The Meloe or Mylabris eichorn is common in the neighbourhood of Dacca, in the Hydrabad country, in Kurnool, and numerous other localities. The insect is about an inch long, and one-third broad, the elytra or wing covers are marked with six cross stripes of deep blue and russet brown. The Buprestis of ancient writers is met with in the bazars under the name of the golden fly (sona-mukki). The Cantharis violacea is often mixed with specimens of Meloe in the bazars. The Telin fly, if procured before the mites have commenced its destination, yields on an average, one-third more of cantharidin than the Spanish fly of the European shops. The blue fly is of uncertain strength, the Buprestis in all the specimens obtained, was quite inert. A species of Meloe called the M trianthema, from its being usually found on the plant named Trianthema decandra (biscopia, Hindi) was described by Dr Fleming. A tincture, acetous tincture, plaster, and ointment of the Meloe eichorn are described in the Bengal Pharmacopoeia. Some prejudice exists against the article on account of its alleged excessive severity of action. This is solely owing to the presence of a greater quantity of cantharidin than that contained in the common fly. Diluting the tincture, and adding to the proportion of laid and wax in the plaster and ointment, perfectly assimilate the action of the indigenous and the imported insects. At the Madras Exhibition of 1855, specimens of the Indian blistering beetles, Mylabris pustulata, and M punctum were exhibited by Dr Collis of Pondicherry, these were accompanied with a full and interesting report on their blistering properties printed in the "Moniteur Officiel" of 2nd March 1855. M pustulata, and M punctum are found in large quantities at certain seasons all over Southern India. The official Blistering Fly has had a variety of names. It was called Meloe vesicatorius by Linnæus, Lytta vesicatoria by Fabricius, and Cantharis vesicatoria by Geoffroy, and now by the Pharmacopœias. The name *χανδαπης* was applied by the Greeks to a species of Coleopterous insect which possessed the properties of the official blistering beetle, but it was distinguished by yellow transverse bands. This is the characteristic of species of Mylabris, one of which, M Fusseleri, occurs in the south of Europe, and another, M eichorn throughout the east. In India it is called telee or telin, and telee mukhee, or the Oily Fly, from the oil-like exudation which the insects of this genus give out from the articulations of their legs when seized. Another species, M trianthema, is mentioned by Dr Fleming, and the Lytta gigas Fab is

MYMENSING

found in India as well as in Senegal. One is mentioned by the Arabs under the name of zurach. Mylabris eichorei and M pustulata are used by the Chinese. About 180 lbs forwarded in 1860 from Bombay by Dr Bidwood to test the market value in England, were sold at 5s 3d per lb—*Royle, O'Shaughnessy*, p 681, *M F J R Cat Lx* 1862 *Dr Hunter, Tr Beng As Soc vol 1* p 216 *Smith Mat Med of China*

MYLABRIS CICHORII

Pan mun, CHINA | Telin, Hindi
Tel Mukhi, Hindi

Of southern Europe, southern and eastern Asia, is obtainable from June till December in the granite district of the Nizams territories and can be gathered for a rupee a pound. In China they are met with on species of Fabi, Dolichos, Euponymus, Silene and other plants. It is considered in China useful in scrofula, renal ailments, syphilis and hydrophobia—*Smith Mat Med of China*

MYLABRIS SCHONHERII

MYRICA CERIFERA, the Candleberry myrtle abounds in the Bahama islands and might be introduced into India. The shrub produces a small green berry, which, like the hog plum, puts out from the trunk and larger limbs. Much patient labor is required in gathering these berries, and from them is obtained a beautiful green wax, which burns very nearly, if not fully, as well as the spermaceti, or composition candles. The method of procuring this wax is by boiling the berries in a copper or brass vessel for some time. Iron pots are found to darken and cloud the wax. The vessel after a sufficient time is taken from the fire, and when cool the hardened wax, floating on the top of the water, is skimmed off.

MYRICA CORDIFOLIA The wax tree of Louisiana contains immense quantities of wax. According to the experiments of M Cadet and Dr Bostok, myrtle wax differs in many respects from bees' wax. Specimens of it assume shades of a yellowish green color. Its smell is also different, myrtle wax, when fresh, emitting a fragrant balsamic odor. It has in part the unctuousity of bees' wax, and somewhat of the brittleness of resin. Its specific gravity is greater, inasmuch that it sinks in water, whereas bees' wax floats upon it, and it is not so easily bleached to form white wax. The wax of the *Myrica cordifolia* of the Cape, is used for candles — *Simmonds O'Shaughnessy, Bengal Dispensatory* p 612

This tree occurs in different parts of the Himalaya from the Sutlej to Nepal and Silhet, fruit agreeably flavoured. The same,

MYRISTICACEÆ

or a nearly allied species, is found in China and Japan, in the Sutlej valley between Rampur and Sungnam. Fruit used for making sherbet. The fruit is edible, with a sweetish bitter taste. It ripens in June. In the Himalaya it is generally met with at an altitude of from 4,000 to 6,000 feet, and its bark is exported to the plains as a dye and as medicine. On the lower Sutlej, it is common, and a few trees may be seen at from 3,200 to 6,000 feet up to the Ravi. The bark is aromatic and stimulant, and a favourite native medicine. The fruit has not much flesh, but is a pleasant sour sweet. It is mostly used in sherbets. The bark is official in the plains, being considered hot, and given in rheumatism, and mixed in plaster. — *Dr J L Stewart, M D Powell's Hand-book*, vol 1 p 314 *Cleghorn Punjab Rep* p 65 — *Hogg Vegetable Kingdom*

MYRICARIA ELEGANS, Royle

Humbu, umbu, of Sutlej, and Ladak

This is one of the Tamariscinæ. Dr Stewart found it at 9,000 feet sparingly on the Sutlej, and it grows from 10,000 feet on the Upper Chenab to 15,000 in Ladak. The leaves are often covered with a saline efflorescence, in Lahoul its leaves are applied to bruises, &c. The twigs are in Ladak browsed by sheep and goats.

Jytee,	BRG	Jatiputri,	SANS
Jae putri,	DUK		

A tree with small, pale yellow, and odorous flowers, successfully cultivated in Sumatra, Bencoolen, and Penang The girth is 6 to 10 inches, a foot above the ground It branches like the laurel and its loftiest sprays are frequently fifty feet high The fruit when ripening resembles a peach, and on removing the epicarp or fleshy outer rind, is a spherical nut, black, clasped by a fine branching ail, of a vermilion colour, which is the mace of commerce When ripe the fruit is picked, the outer part removed, the mace taken off and dried in shallow baskets in the sun The nut contains a volatile, as well as a fixed oil The wood is said to be hard and close grained, the culture of the nutmeg tree has been successfully commenced both at Meigu and Maulmain Behind the hill at Maulmain, the trees appear to thrive, and at Meigu the trees were thriving Nutmeg butter is prepared by beating up the nutmegs, enclosing the paste in a bag and exposing it to the vapour of water, and afterwards expressing the fat by means of heated plates The nutmeg tree is monocious as well as dioecious, but no means exist of discovering the sexes, before the period of inflorescence, is known Upon an average, the nutmeg tree fruits at the age of seven years, and increases in produce till the fifteenth year, and is said to continue prolific for sixty or eighty years Seven months in general elapse between the appearance of the blossom and the ripening of the fruit and the produce of one bearing tree with another, under good cultivation, in the

fifteenth year, may be calculated at five Pounds of nutmegs, and a pound and a quarter of mace. It bears all the year round, but more plentifully in some months than others, and generally yields more abundantly every other year. It is necessary that the roots of the trees during their growth should be kept well covered with mould, for they have a tendency to seek the surface. The growth of the lateral branches is to be alone encouraged, and all suckers, or dead and unproductive branches, are to be removed with the pruning knife, and the lower shoots lopped off, with the view of establishing an unimpeded circulation of air."

The *arillus* or mace is thick, between horny and fleshy, much lacerated, folded and anastomosing towards the extremity, almost enveloping the nut, when fresh, brilliant scarlet, when dry, more horny, yellowish brown and brittle. The smell and taste of the *arillus* are peculiarly fragrant and agreeable. It softens, but does not dissolve in the mouth. Beneath the *arillus* is found a bony shell, which covers the almond or kernel, this shell is thin, hard, brittle, brown and shining above, pale grey within, insipid and inodorous, and encloses the nutmeg of commerce.

The *kernel* is large, rounded, obtuse at both ends, the size of a small myriobalan nut, smooth, marked with reticulated chinks, those transversely placed being less evident than the longitudinal, grey externally. In the chinks occurs a whitish powder, apparently chalk, internally the almond is traversed by branching, reddish, irregular greasy veins, giving it a marble appearance. The nut is hard and easily cut, scraped, or grated, very inflammable, but the smoke is devoid of the fragrance of the acid. The odour of the nutmeg is most agreeably aromatic, its taste hot, and analogous to the smell. The nut readily divides under the teeth, and is partially soluble in the saliva. Nutmegs are much injured by time, becoming the prey of insects, which perforate them in every direction, sometimes good nutmegs are adulterated with others from which the valuable principles have been extracted by alcohol. Worm-eaten nuts are also fraudulently repaired by the introduction of a paste of flour and nutmeg oil into the holes.

The *Essential Oil of Nutmegs* is white, lighter than water, acid, pungent taste, and very powerful nutmeg odour.

The *Fixed Oil, or Butter of Nutmegs* occurs in the commerce of Europe in flattened masses, of square form, yellowish, solid, internally marbled, 500 parts containing about 50 of essential oil. This substance is much adulterated, particularly with suet, sper-

maceti, marrow, wax, the oil of the *Moringa pterygosperma* coloured with alkanet or iocoon, &c, &c. The fixed oil is obtained by bruising the nutmegs into a paste, which is compressed in bags between hot metallic plates. Two kinds are found in commerce—one in small earthen pots, of mace colour, and very agreeable smell, is exported from the Moluccas, to Holland chiefly, the second kind is obtained from Holland, occurs in flat cakes, is far inferior to the first, and is usually adulterated with spermaceti. The chief use of nutmegs is as a spice, and for the preparation of perfumes and scented soaps. The tree, according to M. Jec, was altogether unknown to the ancients, and *Kewar* of Theophrastus and the *Cinnamomum* of Pliny have been erroneously regarded as identical with this. *Avicenna* seems to have been the first who described it under the name "*Jambou*." The tree itself, however, has only been identified clearly within the last few years. The nutmeg tree is chiefly cultivated in the Banda islands, but plantations are now numerous at the Mauritius, Bourbon, Cayenne, Martinique, and in the English possessions to the Eastward, especially in Province Wellesley, Penang, and also in the Tinnevely district of Southern India. The natives of the Moluccas gather the nutmeg fruit by the hand, strip off and reject the pulpy pericarp, detach the mace carefully, and expose it to the sun, which soon changes its blood-red colour to a light brown, it is then sprinkled with sea-water to render it flexible, and to preserve it. The nuts are first sun-dried, and then smoked, until the kernel rattles against the shell. This envelope is then broken, and the kernels dipped twice or thrice in lime-water. They are then heaped together for two or three days, wiped, and packed in bales or barrels. The nutmegs thus prepared have been long termed, "female," or "cultivated," in commerce, to distinguish them from a kind named the "wild" or male, which is less esteemed, and seldom found in European trade.—*Bilmore* 223. *Penang Gazette Riddell O'Shaughnessy*, pp 535, 536. *Amslies' Mat Med* p 264. *Royle Mat Med McCulloch's Commercial Dict* p 852. See Nutmeg.

MYRISTICA OTOBA

Viola sebifera, Lamour. | *Myristica sebifera, S. Fe*

A large tree of Cayenne and Guiana yields aromatic nuts which when boiled with water give out a large quantity of a fixed oil, used for making candles. An acid juice also exudes from incisions in the bark, and is employed as a popular medicine.—*O'Shaughnessy*, p 537.

M malabarica, Lam | Male nutmeg tree, Eng

A tree of the Moluccas, Malabar, S Concan Small yellowish flowers

The fruit is downy, its substance fleshy more solid, and firm The kernel is covered by a hard shell provided with a pale arillus, the kernel is $1\frac{1}{2}$ to 2 inches long, elliptical, the parenchyme devoid of mairblug Its odour is weak, flavon disagreeable The mace of this nutmeg is distinguished from the true mace by being formed of three or four regular bands united at the summit The chemical composition of the article is analogous to that of the true nutmeg, but the oils are so inferior in proportion, that the "male" nutmeg is but of little commercial value in Penang, its fruit is used as a substitute for the true nutmeg—O'Shaughnessy, p 537

MYRMELEON GRAVIS, Walker, one of the ant-lions of India whose larva have earned a bad renown from their predaceous ingenuity Ceylon has, at least, four species, which seem peculiar to the island, viz, Palpaes contrarius, Walker, Myrmeleon gravis, Walker, M diuus, Walker M barbarus Walker The form of the larvæ at the lower part resembles that of a spider, but the head is armed with a sharp strong pair of claws They excavate, in fields, gardens and roadways, small cup shaped cavities, with exquisitely smooth edges and sides, at the bottom of which they lurk, so that any insect approaching near, immediately falls below to the ambush and is seized and destroyed Their excavations are usually carried on at night, but in the

MYRMICIDES

process they throw up the sand and gravel to a considerable height, the soil around their cups is very level They often throw up a particle of sand towards any adhering insect, which, by moving the mass, brings down the insect with it One of the huge black ants was seen to fall into one of the cups, and was seized by the ant lion, but its comrades adhered to the captive to release it—Walker in Tennent's Sketches of the Nat Hist of Ceylon, p 411

MYRMICIDES A tribe of insects comprising the ants

The genus Atta, comprises 6 species of ants, all of small size, having a sting, two knots in the first segment of the abdomen, antennæ not concealed in a cleft, thorax without spines, and short palpi

Atta minuta, Jerdon Worker, barely 1-12th of an inch long, head oblong This minute species makes a temporary nest in various situations, in any empty box, between the back of a book and its leaves, even among the loose pages of a book, in an empty shell, &c &c Nothing is used in its construction, a shelter from the light merely being sought for It is perhaps not very numerous in individuals, one wingless female is generally found in the nest It is very common in the Carnatic and most parts of India, but not seen in Malabar It appears to prefer dead animal matter to saccharine or vegetable products

Atta destructor, Jerdon Worker, about 1-10th of an inch long, head oblong, not so long in proportion as in the last, eyes small, colour rufous, abdomen glossy brown They live in holes in the ground, or in walls, &c, and are very numerous in individuals They prefer animal to vegetable substances, destroying dead insects, bird skins, &c &c, but also feed greedily on sugar They are common in all parts of India, and often prove very troublesome and destructive to the naturalist

Atta domicola, Jerdon Worker about 1 6th of an inch long, head oblong, eyes moderate size, head, thorax, and legs, deep red brown, abdomen blackish This species of ant does not seem to be common, only hitherto procured at Nellore in a hole in a house and only one kind of individual seen

Atta rufa, Jerdon Worker, 1-8th to 1-6th of an inch long, head short, oblong, eyes rather small, medial, of an uniform glossy rufous colour, with the end of the abdomen somewhat darker Worker variable, about $\frac{1}{4}$ th inch long, head large, very square Female about 7-24th of an inch long It is very

common in Malabar, also found in the Carnatic in holes under ground, about gravel walks, mud walls, and often appears in houses, coming through a hole or crevice in the floor, or wall. From a colony of them, every row and then, vast numbers of winged females, (and males) issue forth just before sunset attended as far as the window by swarms of the neuters of both kinds. Its favorite food is dead insects and other matter, but it also carries off seeds, chaff, &c &c like the *Ocodoma*. It stings very severely, leaving a burning pain that lasts for several minutes.

Atta dissimilis, *Jerdon*. About 1-10th of an inch long, head oblong, abdomen long, oval, colour blackish throughout. This ant is found in small numbers on trees in Malabar.

Gen. *Myrmica*. Antennæ sufficiently exposed, head triangular, without spines, maxillary palpi long, of six joints, jaws triangular, three cubital cells in the upper wings, the third incomplete, &c.

Myrmica diffusa, *Jerdon*. Worker, rather more than 1-9th inch long, head and body rufous, abdomen dark glossy brown. Female

length 5-12th of an inch wings not so long as abdomen. Male—, head very small, eyes large, length 1-7th of an inch found throughout India. It makes its nest in holes in branches of trees, runs with its abdomen turned upwards almost over its head, especially when excited, and feeds on honey and other vegetable secretions. Occasionally they appear to form their nest among the roots of moss, orchideæ, and various epiphytic plants, at least this is the case in Malabar. It is very pugnacious, and bites very severely, not appearing to use its sting much.

Myrmica rufa, *Jerdon*. Worker, length 9-48th of an inch, entirely of a rufous colour. This is a very closely allied species, and is found in the same localities as the last. Its habits are similar.

Myrmica Kirbyi, *Sykes*? head, thorax and legs dark maroon, abdomen dark brown. Length 7-48th of an inch, found chiefly in the elevated forests of the Wynad. It forms a considerable nest of some papyraceous materials, usually of an oval form, and placed round a small branch which supports it. It is very numerous in individuals, countless swarms issuing from it on being disturbed and boldly attacking the assailants both with teeth and sting. It feeds on honey or flowers and other vegetable secretions. The nests are built on different kinds of trees and shrubs, the *Syzygium jambolana*, *Coffea Arabica*, *Psidium*

pomiferum, *Citrus aurantium*, &c. A nest taken from a *Syzygium jambolana* at Nagalore, Shivaroy Hills, weighed 3lbs 8oz, irregularly oval in form, extreme length 19 $\frac{1}{2}$ inches, girth or circumference in the centre, 32 $\frac{1}{2}$ inches, and sufficiently solid to withstand moderate force. The nest was situated about 30 feet from the ground, on a fork of the tree, and was built round some of the branches, which protruded through it in various directions, the girth of the thickest or lowermost branch of the fork measured 1 $\frac{1}{2}$ inch, all the other branches that protruded through the nest were much smaller. The structure was made up of a fine mixture of cowdung and leaves of various kinds, but the outside was well smeared with cowdung, and honeycombed with tile-like appendages, which whilst they permitted the free ventilation of the interior, at the same time, by a slight projection of the scale-like leaves, rendered the nest impervious to rain. These diminutive creatures put on, threatening attitudes with their abdomens flexed over their back or thorax, and their mandibles extended. They ran to and fro in a state of excitement in search of the enemy, on whom, when found, they at once advanced, and used their expanded jaws to such purpose as to cause extreme pain to the individual attacked. Considering their small size, the ferocity and undaunted courage they exhibited, and their readiness to attack man or beast who approached them were very remarkable. A battle had taken place between the inhabitants of two nests, numbers even in death clinging to each other, and the survivors were but few in number. The victors were already busily engaged in plundering the nest of the vanquished of its cocoons, and carrying them off to their own.

Myrmica tobens, *Jerdon*. Worker, length 4-12th of an inch head, thorax, legs and abdominal pedicels maroon colour abdomen shining brown. Female, head rather smaller proportionally. This is one of the most common and abundant ants in Malabar, not seen in the Carnatic. It seldom enters houses, it otherwise appears to take the place of *Formica indefessa*, which is not found in Malabar. It feeds chiefly on honey and other vegetable secretions, but also will take dead animal matter. It is also found in the train of caterpillars feeding on leaves. It makes large excavations under ground, generally having the entrance round the trunk of a tree, and it forms considerable heaps of fine earth round the mouth of the nest. It runs with its abdomen turned downwards under the abdominal pedicels.

Myrmica tarda, *Jerdon*. Worker, length

MYROBOLON

1-6th of an inch, head, thorax, legs abdominal pedicles, black red, abdomen dusky, dark blue This very curious looking ant, is found both in the Carnatic and Malabar, lives in holes in the ground in small societies, and feeds on vegetable secretions It moves very slowly

Myrmica ecoca, Jerdon *Ocodoma* ? Worker, length 1-5th of an inch, head, thorax, and legs reddish brown, abdomen glossy brown, found once under a stone in the Wynaad—Dr Jerdon in *Madras Lit Society's Journal* A brief account of the *Myrmica Kribi* as found in Southern India, By John Shortt M D, F L S in *Linnæan*

MYROBOLON, also myrobolan and myrobalan The substances known by this name are the fruits of several East Indian trees, and are used in India as substitutes for galls When ripe, the fruit is pear shaped, deeply wrinkled, of a brownish, yellow colour, and weighs from 70 to 100 grains The husk contains the whole of the astringent matter, some mucilage, and a brownish yellow colouring substance, which is used in India for dyeing yellow The husk is usually separated by bruising the nut, which it encloses The tannin of myrobolans differs slightly from that of galls Gallic acid is present in rather large proportion The price of myrobolans in June 1852 was quoted at from 5l, to 10l per ton, 8s to 12s the cwt Six kinds of Chebulic myrobolans all known as Hehlel are used in India Hehlel-Zina, the fruit is dried when just formed, and the size of a cummin seed or Zina H-i-Jawi, the fruit dried when the size of a jao, or barley-corn H-i-Zangi, the fruit dried when of a larger size and black like a negro H-i-Chini, larger than H-i-Zangi, and greenish H-i-Asfar, the fruit near maturity and yellow (Asfar) H-i-Kabul, the fruit at full maturity Mature Cabul myrobolans sell for a rupee a piece in the Bombay market, under the name of Saiwai-i-Hind

The Unguent corn or Myrobalan of Pliny, the *βαλανος* of Theophrastus and the Greeks referred to a species of *Moringa*, probably *M aptera* of Africa and Arabia, though *M pterygosperma* has been named

The Myrobolans of commerce yielded by the *Terminalia chebula*, *T belerica* and *T citrina* are called also gallnuts and are oval fruits of a dingy yellow colour, containing much tannin, hence, they are useful to the tanner as well as to the dyer With alum, this fruit yields a good durable yellow, and with salts of iron, a black colour, little inferior to that produced by oak galls The myrobolans although a very common dyeing

MYROBOLON

and tanning material of India from time immemorial, have not been many years introduced into European commerce but successful have they been found, that, by the year 1852, they had become a very important article of trade, and the consumption rose to fully 2,000 tons annually On this subject, the Canara Local Committee, writing in 1855, observed as follows — 'During the last season a sudden demand arose for the gallnut, (myrobolan) and large profits were made by the persons who collected it from the jungles The exports for five years had been as follows' —

Fusly 1256	Candies 207	Mds 3	Rs 918
1260	380	16	1,877
1261	537	19	2,860
1262	530	17	2,614
1263 ..	2,154	4	3,029

In 1853 4 the exports from Madras were 4145 cwt value Rs 8,447

All the three myrobolan trees are to be met with throughout India In Bengal they grow in abundance In Java, we are told by Buntius, that the Dutch were in the habit of employing the emblic and belerica sorts daily in their hospitals, in dysentery, and bilious affections

Har or Hara, from *Terminalia chebula* and other species, three in number, comprise all the discarded myrobolans of the old pharmacopæas

The myrobolans as brought into Cashmere from Delhi and Harowtee, Hindustan and the Dukhan, are of four kinds namely

Gural hara — Astringent and purgative used in mesahis given in medicine to children four seers for one rupee

Jurwal hara — Used in the same way eight seers for one rupee

Chapel hara, used only in dyeing ten seers for one rupee The whole are much used in dyeing According to the size of the myrobolan its value augments, so that a very large one may be worth one hundred rupees or more, the natives believing that the very large ones have the virtue of causing purging by being merely retained in the hands The Har or Hara, says Dr Irvine, is one among the articles of the native materia medica than which no one is more vaunted It is considered to possess wonderful general deobstruent and purgative qualities, &c, &c while those who thus belaud it, are apparently not aware that this is the chebulic myrobolan (*Terminalia chebula*) of English pharmacopæas of the sixteenth century and long since described

The bellerie myrobolon, is the fruit of the *Terminalia bellerica* in its dried state, is little larger than a gall-nut, but not so regular in shape, of a dirty brown colour, and astringent taste. It is supposed to be similar in its properties to the chebulic myrobolon, but in a much weaker degree. It is much used in India as the basis of several colours, and also in medicine. Small quantities have of late years been exported from Bombay to Britain. This article is sometimes used by the natives in its dried state in cases requiring slight astringents. The large tree which produces it is common in Mysore, where it is called Tam — *Paulkner Ainslie's Mat Med* p 28 *Mason*

MYROBOLON, BLACK, or INDIAN

Heleclaj aswad,	Arab	Heleclaj aswad,	PERS
Zengi hai,	BING	Kinkadagi,	SANS
Hemuz, Hemuz Guz	HIND	Smbgi,	TAM

Is the unripe dried fruit of the *Terminalia chebula*. It is about the size of a pistachio nut and of a deep black colour, oblong, pointed at both ends, slender, and has scarcely the rudiment of the nut. It is used by the natives of India as a brisk purge, and also as a dye. In Bengal and in most parts of the Western Presidency they are grown in abundance. They are largely exported from Bombay to the Arabian and Persian Gulfs — *McCulloch Com Dut Paulkner*

The myrrh of commerce is believed to be produced from several trees, Balsamodendron gileadense Kunth, the Balsam of Bruce and a synonym of Amyris opobalsamum, Forskal, and of Balsamodendron opobalsamum

The Balsamodendron myrrha of Nees, the Karbeta of the natives, seemingly identical with B Kua of Mr Brown's MSS

Myrrh is mentioned in Gen xxxvii v 25, and in Exod xix 23, by the name of Mori or Mur. The Greeks called it *μύρρα*, and also *συμύρα*. Herodotus mentions it as produced in the south with Frankincense, &c. Dioscorides states the variety called Trioglyptea to be the best. In the Periplus of the Red Sea, Arrian mentions myrrh with olibanum as exported from the coast of Barbana, that is, the modern Berbera. Bruce learnt that it as well as Frankincense, was produced, in the country behind Azab, or in that of the Dankil. The embassy to Abyssinia under Major Harris met with it on the hills, in the comparatively flat country which extends from Abyssinia to the Red Sea, near the Straits of Bab-el-Mandeb, or from the Dooni Valley to the

banks of the Hawash. Mr Johnston (Trav p 249) met with it in nearly the same locality. Both authors describe the myrrh as exuding from wounds made in the bark, and say that it is collected in January and March, but chiefly in July and August, and in small quantities at other times of the year and exchanged for tobacco with the merchants who proceed to Berbera, &c, whence it is exported to the coast of Arabia

Myrrh reaches Europe chiefly from Bombay, having been imported there from the Arabian and Persian Gulfs. It used formerly to be obtained also from Turkey. Ehrenberg and Hemmich found a small tree in Arabia near Gison, on the borders of Arabia Felix, from off which they collected some very fine myrrh

The Balsam of Bruce was found by him at Azab, and said to extend to the Straits of Bab-el-Mandeb. Gerloch found it at Bederhumu, a village between Mecca and Medina. Forskal found his Opobalsamum at Hies in Arabia Felix. At Aden it is called Beshan. Dr Roth, in the Appendix to Harris' Abyssinia (ii p 144) mentions B Opobalsamum as occurring in the Adel country, and the jungles of the Hawash along with the Myrrh tree. The bark when wounded exudes the fragrant Balm of Gilead balsam, which seems to have been cultivated in Palestine near the town of Jericho. It is no doubt possessed of stimulant properties

Balsamodendron myrrha Dr Ehrenberg collected from off this tree very fine myrrh on the borders of Arabia Felix. It is stated in the Appendix to Harris' Abyssinia (ii 414) that the "*Balsamodendron myrrha* (Karbeta of the natives) grows on the borders of Effat and in the jungle of the Hawash, and in the Adel desert. The resinous gum called Hofali is collected for exportation

B Opobalsamum (Besham) grows commonly with the former, and grows even at Cape Aden

Mr Johnston, says "there are in the country of Adel two varieties, one a low, thorny, ragged-looking tree, with bright green leaves, trifoliate, and an undulating edge, is that which has been described by Ehrenberg. This produces the finest kind of Myrrh in our shops. This may be either B Myrrha or one of the forms of B Opobalsamum. The other is a more leafy tree, with the appearance of the hawthorn, having the same largely serrated, dark-green leaves, growing in bunches of four or five springing by several leaf-stalks from a common centre. The

flowers are small, of a light green colour hanging in pairs beneath the leaves. The fruit when ripe easily throws off the dry shell in two pieces, and the two seeds it contains escape. The outer bark is thin, transparent, and easily detached, the inner, thick, woody. When wounded, a yellow turbid fluid (the gum-myrrh), immediately makes its appearance. Naturally, the gum exudes from cracks in the bark of the trunk near the root, and flows freely upon the stones immediately underneath. Artificially, it is obtained by bruises made with stones."

Balsamodendron Africum Ainnott — *Hendelonia africana*, *Gurll et Per* first found on the west of Africa, occurs also in the Abyssinian collection, having been found in the flat country of the Adel. Mr Johnston immediately recognized it as one of the trees yielding gum-resin. The leaflets are like those of *B. Kna*, *B. I* yields African Bdelhum, or that imported into France from Guinea and the Senegal, according to M. Ponnottet. M. Adanson mentions it by the Senegal name of Niotont as producing Bdelhum. It may also yield the Bdelhum which is exported from the west coast of Africa. Dr. Malcolmson wrote to Dr. Royle that "bdelhum is produced in Africa by a tree similar to the myrtle, none is obtained in Arabia it is very similar to myrrh, and sometimes sold for it."

One kind of bdelhum is produced in India, which Dr. Royle was informed is yielded by a tree called googul by the natives and which is the *Amvis commiphora* *Roxb* referred by Messrs. Wight and Ainnott to *Balsamodendron*. Dr. Walker, in his account of the drugs produced near Aurungabad, states "a gum-resin, called by the natives googool, is produced by a tree (*Dr. W* calls it *Amvis bdelhum* ? *Roxb*) which grows in the neighbourhood of Umber, a town twenty miles to the westward of Aurungabad. Roxburgh imagined that Googool was identical with Myrrh."

Myrrh is generally in pieces of irregular form and size, formed apparently by agglutinated tears, dry, and covered with a fine dust, commonly of a reddish-brown colour, brittle, fracture irregular, conchoidal, shining with the surface apparently dotted with volatile oil, often variegated, with opaque, whitish, semicircular marks. The smaller pieces angular shining, semi-transparent, taste bitter and aromatic, the smell peculiar and balsamic. Specimens brought by the Abyssinian embassy have granular fragments mixed with roundish tears, and some of a pale, even whitish, colour may be seen on

the same piece of bark with ordinary coloured myrrh. Specimens which have not been exposed to the air, are darker coloured, moister, and of a more powerful and agreeable smell.

Indian Bdelhum is sometimes sold for and considered as an inferior kind of myrrh. It is in roundish pieces of a dull dark-red colour, more moist than myrrh, and not brittle like it, softening even with the heat of the hand, bitter and a little acid in taste, with a less agreeable odour. It often has portions of the birch-like bark adhering to it.

The sort met with in India, and brought from the Arabian and African coasts, is in large opaque pieces, generally covered with a brownish white powder. An inferior kind of myrrh, termed in India Bysabole, is also imported from the above places. It has a great resemblance to bdelhum, for which it is not unfrequently mistaken. Myrrh is largely imported into Bombay, and is chiefly re-exported to England. Myrrh has long been in repute in low fevers in Europe, and occasionally in agues. Dr. Kirk found it very useful in the typhoid state which in India is frequently the second stage of paroxysmal fever and also in the low adynamic fever of jails. In Arabia there is an inferior kind called "busa bol," or "hebbakhade," by the Sumrah. Pliny says, that in his time six different kinds of myrrh grew in Arabia, he says myrrh was often adulterated with mastic. In India, there is a substance having the closest resemblance to myrrh which is imported into and known in Europe as Indian myrrh. This is also said very closely to resemble, if indeed it at all differs from, bdelhum, it is probable, therefore, that it is what in India is known by the name of googul (moogl of the Arabians); as it forms the bdelhum of commerce, and resembles an inferior kind of myrrh, as indeed bdelhum is frequently described to be. That it is also the bdelhum of the ancients would appear from the Persian authors giving bndlevoon and madikoon as the Greek name of moogl. Turkish myrrh is considered the finest, the East Indian being the second in quality, it is employed medicinally, as a dentifrice, and in the preparation of fumigating pastiles — *McCulloch Faulkner Ind Ann Med Sci* for April, 1856, p. 387. *Powell Hand Book*, vol. 1 p. 402. *Birdwood Vegetable products Bombay presidency*, p. 20. *Drury Useful Plants* 88. *Poole St of Commerce*. The myrtle is a native of Asia Minor and south of Europe, it assumes the shrubby or arborescent form according to the latitude. The plant in all its parts is most agreeably perfumed. 10 lbs of the leaves afford about a drachm of yellow essential oil of most delightful fragrance. The berries were employed by the Romans as a spice. The Tuscaus still use them and they also prepare from the berries a kind of wine called *Myrtidanium*. A distilled water prepared from

MYSORE

all parts of the plant is employed as a cosmetic, and called *Band'auge* by the French perfumers. The leaves are given in cerebral affections, for flatulence, diarrhoea, internal ulcerations, and rheumatism. The hibb-n-las, though nominally always the fruit of the myrtle, appears at times to be the small fruit of some other plants not yet identified with certainty. The myrtle grows well by layers, and even cuttings, but requires careful pruning, and after the rains all the leaves, on which insects have deposited larvæ must be removed, or the plant will lose its verdure and beauty by the destructiveness of the young caterpillars. — *Lindley*, p 75 *Rudell Gardening* *Luffey Hints to Amateur Gardeners* Dr J L Stewart *Punjab plants*

MYSOLE, a large island of the Eastern Archipelago in the Pitt Passage extending E and W 42 miles and about 20 miles broad

MYSORE, *Masani* or *Maheshwar*, a kingdom in the peninsula of India, with a Hindu Maharajah whose territories since A D 1831, have been administered by a Commissioner. It was usurped by Hyder Ali, a Mahomedan soldier, about 1767, but when his son, Tippoo, fell, in 1799, at the storm of Seringapatam, the territory was restored to a descendant of the native sovereign. This chieftain, after he came of age, ruled the country till 1831, when, during Lord W Bentinck's administration, owing to frequent insurrection, Commissioners were appointed for its management. The rajah died childless in the beginning of 1868, but he adopted a successor who, when of age,

will take the Government into his hands Mysore is a table land from 2,000 to 3,000 feet above the sea, fed by the Tunga, the Budra and Caverry rivers Bangalore, Mysore and Seringapatam are its chief towns The genealogy of this family is traced from the Yadu line of Chandravansa The first in authentic history is Timma Raja Vadyar son of Betta, A D 1530, and the dynasty ruled until A D 1767 When Mysore was destroyed by Hyder Ali and the rajah Chamaraja Vadyar dethroned, but the late sovereign, Krishna Raja Vadyar, was restored by the British in 1799 The teakwood used by the Commissariat, and furnished to the Ordnance Department in the Mysore country, was, until about A D 1830, supplied entirely from the Mysore forests, in the vicinity of Shemoogah The jungle however was much thinned towards 1841, and supplies were got from Hullihal, from which to Bangalore is about 170 miles, the roads are tolerably good, the forest is distant from the village about 15 miles Sheep of the Merino breed were introduced into Mysore by Sir Mark Cubbon The coat is of wool, and the article manufactured from it was superior A quantity of wool that was sent home to test the market value attracted the marked attention of the mercantile community The principal difficulty appeared to be the cleansing the fleece from the penetrating spear grasses, with which the pastures of Southern India abound Colonel Onslow also sent home some specimens of cotton to the same Chamber, who reported very favourably of it, and put upon it very high prices A sample of Mysore gamboge, was sent to Dr Royle, who pronounced it to be identical with the gamboge of Siam The coffee is very fine, and a price is obtained for it in England nearly equal to that of the best Mocha It is carried through the ghauts, to Mangalore Fiaserpet is situated on the road to Mysore from Mercara, and it is also 20 miles from the latter place The river Caverry runs past Fiaserpet, and forms the boundary between Coorg and Mysore

The great central table land of the peninsula of India includes Mysore, the Bara-mahal, the Ceded Districts (Bellary and Cuddapah), Berar, Hyderabad, the Southern Mahratta country, and the four Bombay collectorates in the western Deccan The whole of these countries, with the exception of the parts immediately bordering on the ghauts, consist of a vast undulating plain of various height, almost entirely devoid of trees, except close to villages and towns, and with but little low jungle Here and there low ranges of hills appear, and isolated rocks, or

droogs, mostly bare, others covered with low brushwood Towards the north and west large steppes occur, and the country is more broken by hills and ravines than in the southern part Here too we have greater abundance of low jungle, and even stunted trees, and in many of the ravines wood abounds Considerable tracts of long grass, or 'rumnahs' occur here and there, especially towards the more northern portion The whole of this district was formerly named the Deccan meaning the south

Hyder Ali brought Mysore proper, Coorg with the Carnatic and much of the Dekkan under subjugation, and was at the height of his successes when Chum Raj the titular ruler died Up to this time Hyder Ali had professed to rule Mysore in behalf of the hindu rajah, and, every Dassara, Chum Raj appeared before the people in the state balcony, seated on an ivory throne, Hyder Ali being present as Commander-in-Chief and Minister, but he selected a successor, also named Chum Raj, from amongst the collateral relations, and Hyder continued to rule in reality until his death, on the 7th December 1782

The climate of Bangalore or South Eastern Division of Mysore, is favorable to Europeans The thermometer rarely rises above 90 degrees, and the nights all the year round are cool and refreshing The elevation of the Chittledroog or North Eastern division is somewhat less than that of Bangalore In climate it is similar, but the temperature must be higher, even for natives, this division is not considered so healthy as Bangalore, chiefly on account of its hills being feverish The South Eastern division called Astagram, is very different in every respect from the two first named divisions Its southern and western parts are covered with fine jungle extending to the slopes of the western ghats on the one side, and to the base of the Neilgherry Hills on the other There is more rain and it is hotter in this division than in Bangalore, fever prevails during some seasons of the year, but on the whole the climate is generally a healthy one The Nugger division to the north of Astagram possesses an elevation generally from 2,000 to 2,400 feet above the level of the sea, but there are some parts especially the Bababooden Hills which rise above 5,000 feet The open country is described as healthy while the western half is more or less the reverse Two talooks in this division are said to be higher and healthier than other parts They are called Wustara and Chikmoogloor, and there are a good many situations in them where Europeans might settle with every probability of enjoying good health On

this account these talooks appear to have been selected for the cultivation of coffee, and that plant was here more largely and more successfully cultivated than in any part of Mysore. It is added, however, that there now scarcely remains an acre of land in these talooks suitable for coffee unoccupied by natives, who are most tenacious of their rights to the soil. For health and suitableness to the European constitution Bangalore and its environs are best, Europeans might settle and labor there with every prospect of good health.

Captain Arthur of the Engineers found Native gold in Mysore, disseminated in quartz, and also in an indurated clay also some specimens crystallized, in minute cubes. Captain Warren discovered gold in Mysore in 1800, betwixt Annamal and Poonganoie, disseminated in quartz, and also in the alluvial soil. Two specimens were sent by Lieut Puckle from the vicinity of Bangalore, one in a matrix of dark blue quartz, and another in black sand, a sufficient quantity was procured to make a ring. The natives have long been working for gold at Batmungalum just above the ghats—Heyne mentions that Captain Warren had learned the fact of the natives so employing themselves, in their leisure, and the fact is repeated by Sir Whitelaw Ainslie and Dr Clark, the latter of whom remarks that gold was discovered in the eastern provinces of Mysore by Lieut Warren of H M 33rd Regiment in 1802,—who found it in the small nullahs or cuts or breaks in the ground at Warigum, a small village $4\frac{1}{2}$ miles S W of Batmungalum, also on the banks of the Palar river, and the Ponian near Caaigory. He found gold also at Marcoopium three miles south of Warigum, and worked by natives as it had also been worked by Tippoo. Heyne likewise (p 41) states that gold has been found near the hills to the S E of Ooscottah, and Newbold likewise describes gold as having been discovered by Captain Warren, near the Batterine hills.

A Mysore contingent of 4,000 soldiers has been kept up since the treaty of Seringapatam. The people of Mysore are mostly of the Vira Saiva or Lingayet sect.

The Beder or Veder race of Mysore live by the chase, as hunters and fowlers.

The Mysore toddy drawers are called Halpauk, they speak Tuluva.

The first war against Tippoo, king of Mysore, broke out in 1790. Tippoo attacked the rajah of Travancore but was defeated with considerable loss, General Medows,

Colonel Maxwell and Colonel Hartley, having met with varied success, Lord Cornwallis, 1791, took command, and on the 21st March captured Bangalore. On the 13th May 1791, Tippoo opposed him at Ankera but was completely routed, yet Lord Cornwallis was obliged to retreat. In August 1791, however Cornwallis captured several difficult forts and on the 5th February 1792, he encamped before Seringapatam, and drove the enemy into the fort, and Tippoo came to terms, delivering up half his kingdom, three crores of rupees and two of his sons as hostages. Lord Cornwallis had reached Calcutta in September 1786 and on his return from Mysore, in 1793 he reformed the revenue system of Bengal by a perpetual settlement and he returned then in October to Britain. Mysore territory seems to have been under the control of polygar chiefs, until Hyder Ali assumed the virtual sovereignty in 1742, but in 1799 it passed to a young man whom the British put upon the throne on the storm and capture of Seringapatam, when Tipoo fell in the breach. This Mysore rajah, ruled with little success till 1832, when, during Lord Bentinck's administration, the civil and military jurisdiction was delivered over to a commission, which continues in 1873, until the successor, a minor, come of age.

The taking of Bangalore from Tippoo sultan, on the 21st March 1791, gave the British a permanent position in Mysore, but it was eight years later, when Seringapatam was stormed on the 4th May 1799 that the country came under British control, by the replacement of the Hindu descendant of former rulers on the throne. The Government was resumed in 1832 at a time when the country had fallen into a deplorable condition. Mysore town is on a table land 2,450 feet above the sea. Mysore table land covers an area of 30,886 sq miles and contains a population of 3,300,000 souls.—*Madras Literary Society Journal Universal Review*, p 556. *Madras Exhibition Juries Reports*.

MYSORY or Schonten Island, in the neighbourhood of New Guinea, its northern point is in lat $0^{\circ} 37' S$. It is high and 60 miles in extent.

MYTE-KONNEY also known *Tam* Poinciana pulcherrima, *Linn*.

MYTHE, or Make, is a river rising in the Vindhya Mountains, lat $22^{\circ} 32'$, long $75^{\circ} 5'$, 1,850 feet above the sea. It runs N W,

MYTHOLOGY

145 miles, W 25 miles, S W 180 miles into the Gulf of Cambay, length 350 miles. It receives the Amaos 90, Manchun 55 miles. It is navigable for 15 miles from its mouth. At 50 miles up 100 yards wide.

MYTHOLOGY All the Aryan races have a complicated mythology, which is not the case with the Semitic races. The latter have El, strong, Bel or Baal, Lord, Adonis Lord, Shet, Master, Moloch, King, Ram and Rammon, the Exalted, and other similar terms for their deities. The Aryans, on the contrary, have Zeus, the sky, Phoebus, Apollo, the sun, Neptune, the sea, Mars, war, Venus, beauty, &c. Max Muller has very ingeniously endeavoured to explain this difference by the different character of the language in these two races.

Hindu mythology accords precisely with the Greek in sending the souls of the dead to receive judgment, and according to the sentence of their judge they are thence conveyed to Tartarus or Elysium, to Naraka or Swarga, according to their evil or good deeds.

Grecian mythology is largely mixed up with the mythology of India,—the Ceres of Greece has the Lakshmi of India, Eros of Greece is the Indian Kama, Yama or Dharmarajah is the Grecian Pluto—the Grecian Dionysius is the Indian Rama, Vatarini in the Hindu pantheon has its supposed analogue in the river Styx, and Cerberus has corresponding dogs. Amongst the Hindus, mythology is all pervading. Their history, science, literature, arts, customs, and conversation, are replete with mythological allusions. A respectable knowledge of their pantheon is consequently an almost indispensable preparatory acquirement to the study and comprehension of nearly everything which relates to them. The mythology of India has done much to explain that of Greece and Scandinavia as will be seen by the following list of the principal of the Hindu deities of the present day, and their principal analogues.

Durga, is the analogue of Juno
Narada, god of music—Mercury
Krishna—Apollo
Bhawani—Venus
Kali or Durga = Proserpine
Agni—Vulcan, fire, ignis
Swaha, wife of Agni—Vesta
Aswini-Kumara—Castor and Pollux
Aruna—Aurora
Ata-deva—Diana
Kuvera—Plutus, god of riches
Ganesa—a male Minerva
Indra—Jupiter, god of the firmament
Varuna—Neptune, god of the water

MYTHOLOGY.

Prithivi—Cybele, goddess of earth
Viswakarma—Vulcan, architect of the gods
Kartikeya or Skanda—Mars, the god of war

Kama—Cupid, Eros, god of love
Surya or Arka—Sol, the sun
Hanuman, the monkey god, son of Pavana—Pan

Rama, god of wine—Bacchus
Heracula, an Indian deity—Hercules
Aswiculapa—Esculapius—Genii,
Vaya—Æolus
Sri—Ceres
Anna-Purna—Anna perenna

The religions of the ancient Greeks, though forming collectively one vast polytheistic system, were exceedingly numerous, and dissimilar in their character. Greece and Asia Minor seem to have been parcelled out among a number of deities, each of whom was the paternal god of some city or race, having not only separate rites, but a form of worship widely different. Each deity had his favourite abode, and local attachment, to some valley, or grove, or town, the power and presence of the divinity especially belonged, and hence in Boeotian Thrace, we trace the origins of Bacchus, in northern Thessaly the worship of Apollo, on the Corinthian shores, the rites of Neptune, in Argos, the temples of Juno, and in Ephesus, the worship of Diana. Though acknowledged to be divine out of their own peculiar domains, yet their worshippers were rather averse to proselytism, fearing lest, by an extended communication, the local influence of the deity should be weakened. The sacred object of Ephesian worship, was carefully preserved, from the period of its first formation, through the ages which intervened, till the demolition of pagan temples, which followed upon the rise of christianity. The image consisted of a large block of wood of beech or elm, but, according to some of ebony or vine, shaped into a likeness of the goddess, and evidencing its remote antiquity by the rudeness of its workmanship. The first statues were unshaped blocks and stones, and, hence, the word column, was generally used by the Greeks, to denote a statue. The Greeks worshipped Baal. They identified Baal with Zeus as they did As-tarte with Venus. The heaven-fallen idol of Ephesus, was not a representation of the elegant huntress of classic fable, but an Egyptian hieroglyphic, a personification of nature. In this character she was pictured as a woman, having a number of breasts, to denote, according to Jerome, that, as nature

MYTHOLOGY

she was "the nurse, the supporter and life of all living creatures."

So, even to the present day, amongst the hindoos and other idol worshippers of British India, shapeless stones and pieces of wood are worshipped in every village, the three great idols at Jaggernath are three shapeless masses of wood and similar pieces of wood are used as deities on the left bank of the Bhemah river. Also every village has its own local deity, and the idol worshipped at Tripati is quite dissimilar from that at Srirangam — *Lubbock's Origin of Civil*, p 219 *Hind Theat* vol II p 106 *Milner's Seven Churches of Asia*, p 83 *Sir W. Jones*. See Deo, Grama deva, Hindoo

h

needed because, from 10 to 16 bhugalis, according as the rains are heavy or light, are all that a pair of bullocks can get over. There are, generally, two to four potails in a village, not always of the same caste, for instance the village of Khanpur, zillah of Nandani, has four potails, two mahratta, a Canarese speaking lingaet, and a Kulkarni, and there are a few brahman and mahomedan and pariah potails, but a christian potail is unknown.

The northern limits of the Marathi language stretches on the sea coast from the Kolwan hills or country of the Kol, near the Portuguese settlement of Damim, above the ghauts in a north-easterly direction along the Satpura range, parallel to the Nerbudda, intermingling with the Gujarati, about Nandobar, in the jungly valley of the Tapi. It is spoken throughout Berar, in the open parts of the Nagpur territories, and on the whole of its eastern border it abuts on the countries and languages of the Gonds. From Nagpur, the Marathi trends to the south-west, and near the Chaubasha and Si-bhasha villages of Dongopria and Murg'h to Oodghu, from thirty miles west of Bedei to Sangam and Sadasheepet, it meets with the Telugu and Canarese, touching in advance nearly on Bijapur and Shankashwar, and thence trends south-westerly to the coast at Sidasheghur, skirting the western boundary of the Canarese. From Daman in the northern Konkan, Marathi runs down the coast to the neighbourhood of Goa, both below and above the coast. It there meets the Konkani, which runs nearly as far as Mangalore. And the southern limits of this mixed language is a village four miles north of Upi or Oodapi near Condapore, where Tulu or the language of Canara begins.

Konkani, the mixed Konkani tongue, however appears to be only Marathi with a large infusion of Tulu and Canarese words, the former derived from the indigenous inhabitants of Tuluva of Canara, the latter, from the long subjection of this part of the Konkan to Canarese dynasties above the ghauts. Mr H. Mogling however mentions that the Konkani speaking brahmans of Mangalore, consider it quite distinct from, though cognate with, Marathi. Its limits extend from Goa below the ghauts, to the village above mentioned north of Upi. From this part of the coast in northern Canara, a diagonal line, running in a north-easterly direction towards Bedei, marks the boundary between Marathi and Canarese, of the latter at least above the ghauts.

The Guzerati language spoken in the peninsula of that name, is occupied by Rajput tribes, Gujari, Katti, Kuli and Kun-

bi, all claiming a distinct origin. Gujarati is bounded by the Marwadi, a little to the north of Deesa, to the north and east by the Hindi or Rangri Basha of Maleolm, in Rajputana and Malwa respectively, and in the south it dovetails with Marathi in the valleys of the Nerbudda and Tapi, ending at Hamp on the former river and running into Nandobar on the latter.

The Maratha race largely worship deified heroes. There is a celebrated idol, termed Massoba. In the Chanki, pass, in the Lokenwara range, which forms the water-shed between the Godavery and the Tapi about 10 miles north of Anuragabad, there is a shrine of this deity to which from a circle of a hundred miles, people of all castes resort, brahmin, sudra and dher, but chiefly the Maharastra kunbi. The Jatra is held in the month Chaita, and lasts for four days, during which many sheep are offered in sacrifice. It is in the northern side of the pass, a mere block of stone, with smaller stones at its foot all smeared with red lead. The objects of their pilgrimage are wholly personal, beseeching the deity to give them, or preserve their children, their flocks and then food. The Maharastra people profess brahminism but, amongst them is a more general amount of demon, spirit, fetish, totem, shaman, and hero worship than is observed amongst the other races of the peninsula. The deities Kandoba and Hanuman, are to be seen in every village south to the Tumbudra, and blood sacrifices of sheep and fowls are largely made. Hanuman is the chief of the village gods, and is invariably smeared over with red lead, which is also applied to every bit of stone or wood that has been erected into a fetish god. There is seemed amongst them, also, a more extensive polytheism, than prevails in any other part of India, and an introduction even of the Semitic and Christian names. Between Ellichpoo and Oomraoti, the pariah races are ordinarily called Krishna, a variation of the word christian, all along the tract southwards to Oodghu the Bawa Adam, near Punderpore, is largely worshipped, and the Jabial Abial, worshipped in east Berar, is evidently the Gabriel or Jibrial of the Semitic races. Even amongst the Kunbi race, who profess brahminism, the hindoo deities Siva and Vishnu are little heard of and with consent the editor put up for two days in the temple of the village of Assaye to which the villagers came at the usual periods to worship Hanuman and the serpent, and the officiating priest to wash and ornament its lingam. An officer of Sindia's artillery who had fallen in the battle of Assaye had been

buried beneath a tree, and there the villagers continue to worship his spirit. Sickness is usually attributed by them to the influence of a malignant spirit, and all through the Mahatta speaking districts the practice of the "Bolwan" prevails, viz, the ceremony of propitiating the Bhuta or spirits who have entered a village, inducing them to leave the village and conducting them across the borders with music and a procession. The conductors often move to the next village and thereby cause intense fear and anger, as the morbid influence is supposed to be conveyed to it. Ai, mother, equivalent to the southern Ammun, is largely worshipped in the form of a rude stone smeared with red lead, and her temples are to be seen in lone places, passes and defiles. The Mahattas have public recitations of histories or stories of the gods, called Katha (or Kahta) as the Burmans have the Pui, a theatrical representation. The Gondana or Gondala of the Mahattas is a tumultuous festival held in honour of Devi, perhaps the same as Gondhal.

Since Lord Lake's defeat of the Mahrattas near Delhi, and that by Sir Arthur Wellesly at Assaye, the power of the Mahatta chiefs gradually decreased. The privileges of Mahratta Sirdars under British rule date from the time of the reduction of the Deccan about the year 1819 in the war with the peshwa Bajee Rao. The Sirdars were high officers under the raja of Sattara and the peshwa. Their titles correspond to those of Quarter Master General, Keeper of the Records, Prime Minister, Private Counsellor, &c. Some as the Vinchurkar in Ahmednuggur zillah and the nawab of Sadeinun near Dharwar held such offices under Aurunzeb and other mogul emperors. A few of the lesser Sirdars were feudatories of smaller local chiefs. The grasping policy of the last peshwa, Bajee Rao, made most of them alarmed and discontented. Accordingly, after the battle of Kirkee, most of them were willing to accept the liberal terms offered in the proclamations of Mount Stuart Elphinstone and the other great men who reduced the different provinces. They were as a rule guaranteed the enjoyment of their ancient rights and privileges by treaties entered into by the British Government and still in force. These treaties bind them to provide a contingent of troops, to make adequate police and judicial arrangements in consultation with the Political Agents, for the extradition of criminals. They have generally exclusive civil and criminal jurisdiction in their own territories, in many cases, however, as for example in those of the first class Sirdars

under the Political Agent of Sattara, the treaty provides that in grave offences such as murder, the trial shall take place before the Agent. They are allowed to make their own Revenue Settlements and are not bound to give leases for a definite term as the British Government is by the Survey Act. The amount of assessment and other taxes they are entitled to collect is unlimited. This is a source of constant complaint among their ryots who envy the secure and liberal terms given by the British government. The political privileges of Sirdars are the following. By Regulation 29 of 1827 it was provided that suits against certain persons of rank should not come under the jurisdiction of the Civil Courts. Three classes of Sirdars were thereby established and three several modes of procedure defined. An Agent of Government, now styled the Agent to the Governor for Sirdars in the Deccan, was appointed to try such suits against them as would ordinarily be cognizable by the Judges of Poona or Ahmednuggur. The First Class being persons of the highest consideration under the Peshwa's Government, reference is to be had in the most ample degree to their former privileges as by usage and custom enjoyed. No decree of the Agent against a Sirdar is to be executed without the order of the Governor in Council to whom also plaintiff may appeal, a further appeal to the Queen in Council being open to either party. Suits against the second class are conducted with the same regard for former privilege and usage. The Agent is also to consider the present means of the Sirdar of discharging the debt and to apply equity. Appeal lies to the superior court of the Governor in Council but the decree may be executed against defendant by the Agent himself. The final appeal is as before to the Privy Council. Many of the Sirdars had contracted heavy debts or lost their property in the war with the Peshwa, hence the provision for considering their means in the decree. As the Agent is an Administrative as well as a Judicial Officer, he has ample means of ascertaining their circumstances. The third class of Sirdars are entitled to a similar but rather less regard being had to usage and custom. The strict rules of procedure are, if necessary, to be relaxed in their favour especially as regards decree, appeal lies to the High Court and thence to the Privy Council, but it is the practice of the Governor in Council, as a Special Court, to refer appeals for the opinion of the Judges of the High Court. The Agent for Sirdars is the Judge of Poona. He sits as Agent every Friday, both as a political and

MUSEUM

pense In England, John Tradescant collected curiosities of various kinds and his museum constituted the nucleus or foundation of the famous Ashmolean Museum at Oxford. James Petiver, a London apothecary, formed a cabinet of natural history, in Holland, Albert Seba distinguished himself as a collector of similar curiosities, and in that country, also, John Swammerdam devoted much time and labour to the study of entomology or the natural history of the insect tribes, and to the formation of a valuable museum. The Ashmolean Museum, was presented in 1686, to the University of Oxford by Elias Ashmole, an eminent herald and antiquary. It comprised originally specimens to illustrate natural history, and various artificial curiosities, especially Roman antiquities, and since its establishment numerous additions have been made to it. Among the most celebrated collectors in England during the 18th century may be reckoned Richard Mead, an eminent physician, who accumulated a valuable cabinet of coins and medals, besides other interesting objects, his rival, Dr. John Woodward, who applied himself especially, but not exclusively, to the collection and illustration of British minerals and fossil remains, and Sir Hans Sloane who, at his demise, bequeathed to Government his magnificent museum and library, in the formation of which he had expended upwards of 5 lacs of Rs. This formed the foundation of the British Museum to which has since been added the donations of many eminent and great men as well as the extensive collections which the large annual grants from the Imperial Parliament, reaching latterly to 5, 6 and 7 lacs of rupees for all purposes, have enabled the trustees to purchase. The Imperial Parliament granted £85,000 or eight and a half lacs of rupees for the expenses of the British Museum for the year 1856-57. The British Museum is not supplied with professors to instruct those desirous of information, but has a large staff of officers, whose employment it is to superintend the arrangement, preservation and exhibition of the objects of various descriptions comprised in the collection. This consists of a Library of printed books and manuscripts, objects of natural history in the animal and mineral kingdoms and a magnificent collection of sculptures, coins, drawings and engravings. Its objects, it will be observed from this, are few, nevertheless, it is the most extensive in Britain, perhaps in the world, though there are in London, Edinburgh, and Dublin, indeed in nearly every large town in Britain, museums which have attained a considerable size. On the conti-

MUSEUM

ment of Europe, picture galleries, sculpture galleries, and collections of natural history are to be met with in all the principal towns, and in the United States of America the collections that have been made to rival those of the old world. The oldest museum in India was that of the Asiatic Society of Bengal, which includes a Museum of Natural History and a Museum of Economic Geology, of which Mr. Blyth and Mr. Piddington, for many years had been the respective curators, and under whose care great extensions were made. Dr. Oldham, the Supt. of the Geological Survey established in Calcutta, a Geological Museum, of which that hitherto in charge of Mr. Piddington, formed the nucleus. The Bombay Asiatic Society likewise possessed a museum, particularly rich in specimens of natural history, and which has been greatly indebted to Dr. Carter's efforts, and Bombay also had an Economic Museum which originated in Dr. Buist's exertions and which Lord Elphinstone took under the care of Government, placing Dr. Impey in charge. A museum existed at Singapore, one also at Agia, one at Roorkee, and one at Saugor. These institutions all originated and are nearly all of them supported by the European population of their respective communities, but it is the Madras Government to whom is due the credit of being the first of the governments of this country to establish museums as institutions of the State, and under their auspices, museums of Natural History and Economic Geology authorized six local museums, at Bellary, Cuddalore, Coimbatore, Mangalore, Ootacamund, and Rajahmundry. Laet Winscom formed one at Jubbulpore, and His Highness the Rajah of Travancore one. The numbers of such institutions already existing and their steady increase, everywhere, imply that they provide for some want that is generally felt, and such is, in truth, the case, for to all engaged in particular scientific pursuits, museums, whether they be their own private property or belong to the public, are essentially necessary to enable them to follow up their own investigations, and institutions of this kind afford amusement and instruction to all who take an interest in examining the works of nature and of art. On taking a leisurely survey of a well stored and well arranged museum, the thoughtful observer cannot fail to be struck with the endless variety of forms and the wonderful adaptations of means to certain appointed ends which abound in the kingdom of nature. Every single specimen, whether it be of an animal, a plant, or a

MUSEUM

MUSEUM

mineral, has a history to tell, full of design, abounding in instruction, and replete with beauty. All these varied forms, gathered from all parts of the earth, grouped with the method and order of a scientific mind, are, to a certain extent, exponents of the method and order of the divine Architect, who in planning the fabric and willing the existence of the means of His creatures, had in view certain wise and benevolent ends, which it is our duty and privilege to study, and as far as possible to understand. It may in many cases be difficult to see the uses of beings and objects on which so much care has been bestowed, and for whose propagation and preservation so many precautions have been taken, but we must bear in mind, that the use of an object does not always meet in its direct application to the wants of the pleasure of man. It doubtless has its uses in the great scheme of nature, and as such the naturalist regards its economic application as of secondary importance. Hence, it is rightly viewed, that for a single object, however mean, which does not in some way or other appeal to our sympathy, excite our interest, and confirm our belief in the constant care of a protecting Providence. But visitors who enter a museum can rarely hope to experience such pleasing emotions as these, and it is to be feared that it is but too common in occurrence for many who enter institutions of this kind to quit them again with only some vague indistinct idea of having seen many curious things of which they know neither the objects nor the uses. Such profitless termination of a sight seeing is the result solely of the collections being examined without any definite purpose. By attempting too much, by trying to learn at one or even at a few visits all that a museum can teach, the mind becomes bewildered amongst the multitude of things that meet the eye, and in reality requires no distinct knowledge of any thing it contains, for it is impossible for a person to promiscuously examine all in the museum, however methodically arranged it be, as to acquire a knowledge of all in the animal, vegetable and mineral kingdoms, and in the arts and manufactures (of specimens from all which museums are composed), without that close attention and prolonged study which the acquisition of every branch of knowledge demands. If visitors then sight seeing they must enter such institutions with some definite object, otherwise they will return carrying with them only indistinct glimmerings of information, vague, undigested notions of the many curious things that they had just seen, the nature, uses, or even forms of which, however, had made so little impression upon their minds that they cannot be recalled with vividness sufficient for any useful purpose. In establishing at Madras, the Government Central Museum, it was from the first intended to form a central institution connected with branch museums or repositories in the provinces, all working together and affording mutual aid by an exchange of specimens. The notification of the 11th August 1851, also mentioned that the central institution should combine the objects of a Museum of Natural History and a Museum of Economic Geology, and that the Officer in charge would occasionally print and circulate notes and extracts from publications on points connected with subjects likely to be of use. Of those objects some have been fully carried out. Amongst the periodical returns transmitted to Government, reports on woods, non ores, marbles, sandstones, grinding materials also were published, and arrangements were made for establishing local museums in the larger towns. It consists of a Museum of Natural History, of Geographical Geology, of Economic Geology, and a public library. In the latter considerable progress has been made, and the foundation having been laid it can be rapidly increased whenever desired. The Museum of Economic Geology has aided in extending amongst the community a knowledge of the raw and manufactured products of this country, a report on the marbles of Southern India and another on this country's non ores and non metal and steel, have already appeared, there are ample materials in this collection for hundreds of such resumes. The articles in the Economic Museum have been arranged upon the plan adopted in the Grand Exhibition of 1851, under the four Sections of Raw Materials in the mineral, vegetable, and animal kingdoms, Machinery, Manufactures, and Sculptures, Models and the Plastic Art, the progress may be judged of by mentioning that this department contains about 10,000 specimens in all its sections. The Museum of Geographical Geology contains a very extensive collection of specimens of the rocks and minerals from the provinces over which the army of the Madras Presidency extends, and all so arranged that the geological features of each civil and military division can be studied separately. Museums were formed at six places, namely, Bellary, Coimbatore, Cuddalore, Mangalore, Ootacamund, Rajahmundry. All within the civil provinces of the Madras Presidency. But in addition to these, there is a

MUSHK WALI

An institution was commenced in Calcutta, in 1866, as a National Museum for India, of which the extensive and valuable collections of the Bengal Asiatic Society formed the nucleus of this Museum. It has rapidly increased since 1866 in the Natural History department and a two storied building to cost about £100,000 is to be erected for its reception. The building faces the Maidan and is of great extent. Dr Anderson, who was in charge of it sent collectors out to various parts of India, and the neighbouring countries, in 1870, he had a man in Persia, another in Yarkand, and a third in Nepal, one in the hilly region of eastern Assam, and another in Aikau. Collectors for this Museum accompanied the Abyssinian Expedition, Dr. Anderson was naturalist to the Yunan Expedition with two collectors attached to him. The present officers are the Curator, the Assistant Curator and the Librarian who is also Assistant Secretary. It is the intention of Government to form a Library on a large scale in connection with the Museum but in the meantime and until the new building is completed, it is confined almost exclusively to Natural History.

MUSHAEKH, ARAB A patriarch or devout man, a religious teacher.

MUSHARI, See Kummalei.

MUSHED, the capital of Khorasan. It was for some years the residence of the court of Nadir Shah—*Malcolm's History of Persia*, vol ii p 216. See Kuzilbash, Kavi.

MUSHINA, also Musina, BENG Linum usitatissimum, Linn.

MUSHI-RANG, HIND rat color.

MUSHK, AR HIND PERS Musk.

MUSHKAM, TEL Bignonia, sp.

MUSHK-DANA, HIND or Hubb-ool-moo.

MUSHKI, a western division of Beluchistan. Mushki has several towns and castles, and is occupied by the Mehmasani, the Nousherwan and Mirwan tribes. The Mirwan Brahui are located in Mushk, Jhow and Kolwah. The Brahui entered from the west and point to Khozdar as the capital prior to occupying Kalat. See Kelat.

MUSHKI also Mushkan, HIND a scented kind of rice.

MUSHKIARA, HIND Sambucus ebulus.

MUSHK KAFUR, HIND Laurus camphora.

MUSHK-NAFA, HIND the musk bag of the musk deer.

MUSHK TARA MUSHI, HIND Men-the finest quality.

MUSHK WALI, HIND Valeriana Walli-um, bed-i-mushk, HIND is Salix caprea.

MUSHROOM

faranj mushk, HIND is Calamuntha umbrosa, also Ocimum basilicum.

MUSHOOD WAZIRI, a tribe of the Waziri Afghans, near the Khyber pass.

MUSHRIFF, ARAB PERS HIND A cashier.

MUSHRIK, AR One who gives a companion to the Almighty, a term used by Mohamed in the Koran to designate Christians.

MUSHROO, HIND stuff of silk and cotton Satins, the back or warp of which consists of cotton.

MUSHROOM The Agaricaceae, the Mushoom Tribe of plants, the Fungaceae of Lindley, comprise mushrooms, puff-balls and Mildews. They grow on the earth, and on decayed animal and vegetable substances, scarcely ever on living bodies of either kingdom, in which respect they differ from lichens which commonly grow on the living bark of trees. Dr Royle's collections in the Himalaya, amounted to about forty specimens. Some of the fungi are used as food, others are poisonous, others are parasites and destructive to the plants on which they grow. The Agaricus campestris, the common mushroom, the various species of the Helvella or morel and of the tuber or truffle are all useful as food, but there is great difficulty experienced in distinguishing the poisonous from the edible kinds and only such should be eaten as are raised in gardens in mushroom beds. The Koodiati mushroom is found throughout the Dekhan. Mushrooms are often seen in the Tenasserim bazaari, and the Karens have names for sixty-four different species of mushrooms and the allied fungi. They distinguish the edible from the poisonous kinds, they say, by touching them with the lime that they eat with the betel. If the fungus turns red when touched, it is regarded as poisonous. But they are so careless or ignorant, that sickness and death often ensue after eating them. A new mushroom collected from the stumps of trees Agaricus (Pleurotus) subocreatus is a dendriophyal species, dying readily, is employed in the Straits settlements as an article of food and is nearly allied to the British Agaricus ulmarius, from which it is separated by the volva, remains of which may be traced at the base of the stem. Mr Powell says, there are three kinds of edible fungi in the Punjab, viz the Samarak or Samarugh of the Panjab, also the morel Morchella esculenta, (Phallus esculentus) and the truffle Tuber cibarium, or allied species, called khumba, and knambur. The Agaricus campestris mushroom.

room is usually called "pad baheia," and the morel, "guchi," or "kama guchi." Dr. Henderson mentions that in Shalipur and other districts, where there is "kali" in the soil, the morel and mushroom are both abundant, the former in August and September, the latter in the end of the cold season, after heavy falls of rain. Mohamedans eat only the morel, and consider the mushroom as "haram" or unlawful food. Natives say that every mushroom having a pleasant smell and taste is wholesome. In the Jhang district, an underground morel, called "phaphoi," is found in fields of Jawar (*Holcus sorghum*), and Edgeworth, in the "*Flora Malacca*," mentions an esculent morel, which he calls "banphal, literally wild fruit." It is said that the morel and agaricus have both narcotic effects when eaten. Quantities of the morel are brought from Kashmir to Amritsar. The khumba, or khambur of Muzaffargarh, is of a pure white color, with a powdery surface and destitute of gills, it is very common in the rains, and is much esteemed as an article of food. Fried in the ordinary way they are equal in flavor to English mushrooms. They are called khumba, and when very large khambur. The Morel (*Morchella esculenta*), called "kama also kaehu," are imported into India from Kashmir.—*Royle Ill Himalayan Botany*, 440. *Riddell Dr. Mason's Tenasserim*, Dr. O'Shaughnessy, *Beng Disp.* Dr. Heringberg, p. 223. See Agaricus, Fungus.

MUSHTARI, or Mushti. AR the planet Jupiter.

MUSHTEE, also Mushtighanga musidi, TEL. Strychnos nux vomica.

MUSHTIGAR, KARN. A tribe in Mysore calling themselves Kshatriya and following agriculture but in some respects resembling the Jatti or boxers. This seems a misprint for Kushtigai, a wrestler.

MUSIC. An account of the state of musical science amongst the Hindus of early ages, and a comparison between it and that of Europe, is yet a desideratum in Oriental literature. From what we already know of the science, it appears to have attained a theoretical precision yet unknown to Europe, at a period when even Greece was little removed from barbarism. The inspirations of the bards of the first ages were all set to music, and the children of the most powerful potentates sang the episodes of the great epics of Valmiki and Vyasa. In music, there are two things which should be very carefully distinguished,—the time, and the words or sentences

which are adjusted to the time, they are respectively called in Sanskrit swara and sabhitya. For instance, we may compose a verse and adapt it to a certain tune and sing it. When we understand the sense of the verse, there is one sort of pleasure, and when we hear the song, there is another, independent of the former. Though these two sorts of pleasure intensify each other in combination, they are not identical, and some persons confound one of these with the other. In India the hindoo who attentively listens to a Thangam pattu passes for one possessing a fine musical taste, while in reality, he takes no delight in the tune, but revels in the obscene pictures which this vicious ballad recalls to his mind. Such a one as this, when he attends a party where there are able musicians, would ask for a hint of Muttuvayi, a vulgar ballad; and when the musician declines, he will burst into a vociferous criticism against him and say that the fellow knows no music. Some people though they take delight in music and are daily in the habit of frequenting musical parties, erroneously suppose that each one of twenty-four steps of the Veena or lyre, will utter some letter such as ha, hha, ga, gha, &c. Here are two things confounded, viz, the tune and the letter, there are such absurd lundoes as will say "How pleasant it will be if a musician sings Kalyani ragam on a muthanga or drum" or "if a dancing girl dances to an alapana or suruti." While the reading of the vedas, puranas and other religious books was monopolized by the Vydika religious men and poetry, rhetoric and kindred branches of learning became the hobby of the Lokika or men of the world, music, left without any place and protection, took refuge in brothels. The religious brahmins went so far as to hurl their thunders against those who practised it and said "Gayata na thayam" (that we should not give them any thing). Much attention has not, however, been paid to this injunction and it has often been violated. Europeans have a very low opinion of native music, not certainly founded upon good grounds. Music delights us in two ways, viz, by harmony and melody. The former consists in the agreeableness of two or more sounds uttered at the same time, while the latter is seen in the succession of many sounds. If you take a veena and tightening the strings up to their proper pitch, arrange the sruti properly and touch all of them at once, you have harmony. Your veena may be accompanied by a fiddle having the same sruti, the harmony will be still more pleasing. But if in your veena you touch some of the

MUSICAL INSTRUMENTS

steps with your finger in succession, you have melody For instance touch the second, third, fifth, seventh, ninth, tenth, and twelfth steps, you have a melodious succession of sounds This succession is called *bnavi* by the hindoos In Sanskrit, harmony is termed *suti* and melody *raga* The natives of India know both harmony and melody and are distinguished for their skill in both The vocal music of Europeans is generally thought by hindus to be unattractive But when ladies sing, their naturally sweet voices are deemed to make up a little for the defects of their music Hindoo music is vaster and more various than that of Europe as may be exemplified in the following manner Take a *veera* or *guitar*, and press the string in one of the steps, and move it to and fro We may hear a gradual ascension and descension from one note to another Thus we produce an intervening note between two notes A variety of notes is thus produced to make the melody more rich

MUSICAL INSTRUMENTS

The mahomedans of India have the following wind instruments, viz,

Zufceice

Puttee, a leaf of the *Holcus saccharatus*, *Lin* held between the lips and sounded

Moorechung, or Jew's harp

Shuhnaee, a kind of clarionet, a cubit long, and having a leaf mouth-piece, commonly called *Sooinaee*

Soor, a bass or drone to the *shuhnaee*

Algoa, a small flageolet, a span long

Nagaysui

Poonggee Of this there are two varieties, one made of leather and sometimes accompanies the *kunchnee-ka-tae-fa*, the other of pumpkin, usually played upon by jugglers and snake dancers, &c

Quina, a straight or curved horn, twelve feet long

Tooriee, or *Toortoorree*, commonly denominated by Europeans colley horn, consists of three pieces fixed into one another, of a semi-circular shape

Banka, is the *Tooriee*, with the upper piece turned from the performer, forming it into the shape of the letter S

Banslee, or flute

Sunkh, the Chank or conch shell It is the trumpet of the hindoo temples frequently used by devotees, also as an accompaniment to the *tumkee* Sometimes they play trios and quartettos on the chank shells alone

Nursinga, a sort of horn

The following are the drums, guitars, cymbals, castanets, &c, &c, of the mahomedans, viz,

MUSICAL INSTRUMENTS

Chitkee, or snapping the fingers

Talce, or clapping the hands

Khunjree, a sort of small tambourin, played upon with the fingers

Duff or *Duffi*, the *tambour de basque*, "tympanum," according to Gentius, *Sadi Resa Polit* p 303 A sort of bass tambourin played upon with a stick

Daceera, the largest variety of tambourin, being from a foot and a half to two feet in diameter, played upon with a stick

Dhol, a larger drum than any of the following, both sides covered with leather, and played upon with the hands

D'holuk, or *Dholkee*, smaller than the preceding, and only one side covered with leather

Meedung, a kind of drum which is an accompaniment to the *kunchnee ka tae fa*

Pukh waj, a kind of drum, a *timbrel*

Tubla a couple of drums, played upon at the same time, one with each hand

Nuga

Nugara, or a kettle drum

Ghunnreeal, a plate of brass for beating time, a brass gong

Tukkoray, or *Zavibum*, are small kettle drums, one is called *zay*, the other *bum*

Dunka, or a bass kettle drum, middle size, between the *nugara* and *tukkoray*

Tasa, or *Ta-ha-muifa*, a drum of a semi-circular shape, played upon with two sticks, and invariably accompanied by the *muifa*

Muifa, a drum like a *d'hol*, covered at both ends with leather, but played upon only on one side with a stick

Tubul, an enormously large variety of drum, used in the field of battle

Tumkee, a small circular brass plate, played on by striking with a piece of wood, having a knob at the end

Dhubboos, consists of a rod of iron about a foot long, with a knob at one end and a sharp point at the other, having from fifty to a hundred hollow rings, which when shook rattle against one another used by fuguees, who wield it about, striking their abdomen of a sudden with the sharp point

G'hurra, or empty earthen vessels, or water pots, played upon with the hand

Si-tara three wies, or *Ek Tara*, when with one steel wire, called by the latter name sometimes it has nine or eleven steel wires, but generally three, whence its name, from three, and string or wire

Tumboora, a sort of *seeta*, (*guitar*), having catgut strings instead of wire

Sarung, or *Sarungee*, a musical instrument like a fiddle, played upon with a bow

Rubab, a kind of violin or *rebeck*

MUSICAL INSTRUMENTS

Been, or Vina, a sort of seetar but having two dried hollow pumpkins (*Cucurbita melopepo*, *Willd*) fixed to the end of it, with five or seven steel strings, described by Sir William Jones in the *Asiat. Researches*

Keenggeec, similar to the preceding, but having three or four pumpkins, and only two steel strings generally used by hindoos

Qanooi, a species of dulcimer, or harp

Uugun, a kind of organ

Ragmala

Chukua, a kind of violin

Thalce, a flat earthen dish on which they rub and rattle a stick with both hands

Theekice, two bits of sticks or fragments of earthen vessels used as castanets

Doroo, a small double headed hand drum

Surod, a kind of guitar (or seetar), having catgut or silk strings

Duppia

Munjeera, or Jhanjh, a kind of small cymbals in the shape of cups, struck against each other, and accompanying most bands

Tal, cymbals, used by devotees, and frequently as an accompaniment to the tafia

Ghugice, one or two hollow rings with pebbles in them, worn on one or both thumbs, and rattled

Goonghroo, little bells fastened to a string, which is wound round the wrists and ankles, and which jingle at every motion of the limbs

Saz

Seekhan, a piece of iron about a cubit long, with which singers pierce their necks and cheeks. Also,—An Arab musical instrument, used by the Arabians who frequent the Malabar Coast

The following are the musical instruments played as accompaniments to the performances of the dancing girls

Drums—Of these there are two, a large oval shaped one termed a d'hol, and a smaller one of the same shape and make, called a malim moorathungum or mathalum. These are hollow wooden cylinders, large in the centre, and narrowed at either extremity, and covered by parchment at both ends

Thoothe or santoothe, a wind bag, somewhat like a bagpipe, this comprises the entire skin of a sheep or goat, freed of hair and having all the openings closed, excepting two pipes or reed, one of which is inserted in the neck, and the other, at one of the extremities, one to blow with, and the other through which the air issues, producing a low moaning sound

Thalum Two pairs of cymbals, (large and small) termed peria and chinna, thalum

A piccolo, termed poolan kushul

A small flageolet, called mogoveni.

MUSICAL INSTRUMENTS

A large flageolet, called peria walum mogoveni

In addition, they sometimes have a clarinet, violin, tambourine, and guitar, but these are innovations of late introduction. In the performance of the hindoo dancing girls in the two dances termed avancum and kanchene naetum, their movements are combined with great agility, ease, and gracefulness, and with their nimble steps, the turning and twisting of their hands, eyes, face, features, and trunk agree, whilst they beat time with their feet. The feet generally placed flat as they seldom dance on their toes—the movements and position combine something of the waltz and Spanish cachucha—they advance, retire, whirl around drop down and rise again with ease and rapidity, whilst the several movements are kept in order with the twirling and twisting of their hands, features, trunk, &c. Some portions of the step resemble the hornpipe and jig, whilst they hop and dance from one leg to another, keeping time, now turning, now whirling, now capering, and now drooping, performing a coquettish pantomime with their antics, then affecting coyness, and dancing away from the assembly, by suddenly turning away as if careless of their allurements, but returning to the attack with greater vigor and increased blandishments. It is indeed, surprising to witness their feats of strength and bodily powers of endurance, for notwithstanding their frail make and delicate appearance, the amount of fatigue they endure, dancing as they do from nightfall to early hours of the morning is astonishing. Their dancing is perfection, and the bodily fatigue they must undergo, from the attitudes and positions they combine in their dances, must be great. In what is called the "Sterna Cothoo" athletic feats are performed, resting their hands on the ground and flinging their feet in the air with great rapidity and thus twirling round and round, successively performing various somersaults, lying full length on the ground with their hands and feet resting, contorting, twirling, and twisting their bodies in various ways, or whilst resting on the hands and legs with their backs to the ground and their chest and abdomen turned upwards, drawing the hands and feet as close together as possible, whilst their bodies are thus arched they with their mouths pick up rupees from the ground. In this arched position beating time with their hands and feet, they work round and round in a circle. During their performance they join their attendants in the songs that are sung and regulate the various movements of their bodies to the expression given vent to in the song

MUSICAL INSTRUMENTS

Modiye doocoonoothoo—In this dance the word "mod" is a term used to designate a craft or enchantment practised by a conjuror who places or hides money or other valuables in a certain place, and often in the presence of his opponent, with the view of testing his ability, and challenges him to remove it, which the opponent endeavours to do by playing on a pipe termed "maked," and if he be not equally skilled, he is struck to the ground in a mysterious manner sick and ill, frequently bleeding from the nose and mouth profusely. The dance is in imitation of this by the girl playing on a maked, dancing at the same time and throwing herself on the ground—the right leg is stretched out at full length, forming a perfect angle with her body out on one side, on the other, the left leg doubled under the knee is stretched out in like manner on the opposite side, producing a most singular appearance, and as if there were no joint in the hips.

Colu Antum, or the stick dance, is formed by a number of girls of the same age, size, and dress, numbering from twelve to twenty four, or more, each having two sticks, one in each hand, about eighteen inches long, well turned, and painted with circular stripes of yellow, green and red. Either to the roof or across a piece of wood used in support for the purpose, a stout skein of thread in different colours is suspended, and having as many strands as there are girls, the free ends of the strands are tied to the ends of the painted sticks each hold, the dance begins with the usual song and accompaniment of music, when each girl striking her sticks dances a kind of jig and hops from place to place exchanging places with each other. This is done with such order and regularity that the several strands are plaited with the utmost regularity into a stout cord or tape of many colours, according to the design. At a sign from the conductor the same is undone, with equal order and regularity, the girls dancing and exchanging places with each other without a single mistake or false step, either in the plaiting or unplaiting of the strands of thread. The readiness, grace, and ease with which the several movements are effected are worthy of admiration. At some places on festive occasions, during the peregrinations of the hindoo idol around the town in procession, these girls perform the stick dance on a platform, which is carried and precedes the idol. More frequently these and other dances are performed on foot in front and at some distance from the procession, which stands still at a certain distance to allow of its being properly carried out.

MUSICAL INSTRUMENTS

Of the Burmese musical instruments, the chief in size and power, is called Patshaung, and may be styled a Drum Harmonicon. It consists of a circular tub-like frame, about thirty inches high and four feet six inches in diameter. This frame is formed of separate wooden staves fancifully carved, and fitting by tennon into a hoop which keeps them in place. Round the interior of the frame are suspended vertically some eighteen or twenty drums, or tom-toms, graduated in tone, and in size from about $2\frac{1}{2}$ inches diameter up to ten. In tuning, the tone of each drum is modified as required, by the application of a little moist clay with a sweep of the thumb, in the centre of the parchment. The whole system then forms a sort of harmonicon, on which the performer, squatted in the middle, plays with the natural plectra of his fingers and palms,—and with great dexterity and musical effect.

Another somewhat similar instrument has a frame about four feet in diameter, and fourteen inches high. The player sits within the inner circle and strikes the gongs with small drum-sticks. This instrument is one of singular sweetness and melody.

The harp of Burmah is held across the lap when played, the curved horn being to the left, and the right hand passed round and over the strings instead of being kept upright like the Welsh harp. Tasselled cords attached to the ends of the strings and twisted round the curved head, serve for tuning. This is done by pushing them up or down, so that the curvature of the head increases or diminishes the tension. These cords are at the same time ornamental appendages to the harp. This harp is a pleasing instrument by itself, but it is usually only an accompaniment to unmelodious chants of intolerable prolixity.

The bamboo Harmonicon or staccato is a musical instrument used throughout Burmah and the Eastern Archipelago. In Java they have a number of such instruments, made in wood and metal, and only slightly differing from one another, though distinguished by different names. In that of Burmah, eighteen to twenty slips of bamboo, about an inch and a half broad and of graduated length, are strung upon a double string, and suspended in a catenary over the mouth of a trough-like sounding box. The roundish side of the bamboo is uppermost, and whilst the extremities of the slips are left to their original thickness, the middle part of each is thinned and hollowed out below. The tuning is accomplished partly by the regulating of this thinning of the middle part. The scale so formed is played with one or two drum-

sticks, and the instrument is one of very mellow and pleasing tone. Though the materials are of no value, a good old Harmonicon is prized by the owner, like a good old Cienou, and he can rarely be induced to part with it.

The musical instruments of Java are the Bonang, Klomo and Gambang — *Tod's Rajasthan*, vol. 1 p. 539. *Native Public Opinion*. Herklot. *Yule's Mission*.

MUSICAL-FISH, or Drum-fish, a sea-fish near the Pearl river near Macao. Every evening, they assemble around a ship and continue their musical humming till about midnight. The noise rises and falls or suddenly ceases at times as they quit the ship in search of food — *Adams*, p. 63.

MUSICANI, an ancient people of upper Sindh, whose capital was Aloī.

MUSICANUS, a chief mentioned in the account of the Voyage of Nearchus. Pottinger finds a similarity between Musicanus and Moo-Sehwan, the names of two contiguous districts in Sind, and usually connected in utterance. They lie exactly where we are told the Greeks found that chief's territories. From the territory of the Sogdi or Sodra, Alexander continued his voyage down the Indus to the capital of a king named Musikanus, according to Strabo, Diodorus, and Arrian or of a people named Musican, according to Curtius. These statements can only apply to the rich and powerful kingdom of Upper Sindh, of which Aloī is known to have been the capital for many ages. There is however nothing to guide us but the general description that the kingdom of Musikanus was "the richest and most populous throughout all India," and that the territory of Aloī was rich and fertile, is known from the early Arab geographers, who are unanimous in its praise. The ruins of Aloī are situated to the south of a gap in the low range of limestone-hills which stretches from Bukkur or Bhakar towards the south for about 20 miles, until it is lost in the broad belt of sand-hills which bound the Nāra, or old bed of the Indus on the west. Through this gap a branch of the Indus once flowed, which protected the city on the north-west. To the north-east it was covered by a second branch, of the river, which flowed nearly at right angles to the other, at a distance of three miles. At the recession of Raja Dahu, in A. D. 680, the latter was probably the main stream of the Indus which had been gradually working to the westward from its original bed in the old Nāra. According to the native histories, the final change was hastened by the excavation of a channel through the northern end of

the range of hills between Bhakar and Roī. The correct name of Aloī is not quite certain. The common pronunciation at present is Aloī, but General Cunningham thinks it probable that the original name was Roīa, and that the initial vowel was derived from the Arabic prefix Al, as it is written Aloī in Biladūn, Edrisi, and other Arab authors. The city of Musikanus was evidently a position of some consequence as Arrian relates that Alexander "ordered Kiartens to build a castle in the city, and himself came there to see it finished." *Pottinger, Travels in Beloochistan, Asiatic Researches*, vol. 15 p. 14. *Cunningham Ancient Geography of India*, pp. 256, 259. See Kabul.

MUSINA, a little mammal of Japan, very like a racoon.

MUSINA, or musnee. **BENG. HIND.** Linnæi usitatissimum.

MUSIRIS. A port known to the Greeks on the coast of Malabar, in all probability, Mangalore. It is alluded to in the Periplus of the Erythrean Sea (supposed to have been written by Arrian) to whom we are indebted for the earliest mention of the peninsula of the Dekhan, and we are informed of Hippalus, the commander of a vessel in the Indian trade, having the hardihood to stretch out to sea, from the mouth of the Arabian gulf and practically test the more theoretical observations of his predecessors. This experiment was successful, and he found himself carried by the south-west monsoon to Musiris. This bold adventure, gained for him the honour of having his name attached to the wind by which he was enabled to perform this novel voyage — *Ind. in 15th Century*.

MUSJID, **AR.** a mosque. Musjid-ul-Haram, the sacred or inviolable temple, i. e., Kaaba. The English letter j amongst the people of Egypt and Turkey, has the hard sound of g, hence musjid is pronounced musgid, from which is the English word mosque.

MUSK

Mishk, Mushk, AR.	HIND	Muschio,	IT
	PERs	Dedes,	JAV MALAY
Kado,	BURM	Moschus,	LAT

Kasturi, HIND	MATAY	Rutta, Oorula,	SINGH
	SANS TIM TEL	Almizele,	SP

Musk is a secretion in the preputial follicles of the musk deer, the Moschus moschiferus, and is sometimes adulterated with dried blood or catechu. If the former

MUSK

be present, agitation with distilled water will often form a solution, coagulated by heat. The latter is detected by adding a solution of minute of iron to the water in which the musk was diffused: a deep black colour is produced if catechu be present. Globules of lead are often fraudulently introduced into the sacs, the best test is the strength of the alcoholic solution. The Musk deer is found in the Himalaya, Siberia, Tonquin, and Cochinchina. A substance analogous to musk (in Hyacinth) is brought to Bombay by merchants from Zanzibar. True musk is only found in the follicle of the musk deer, in the rutting season and in the early winter. Good musk is in irregular unctuous, light, dry, reddish-black, or dark purple grains, concreted in a slightly oval bag, about $1\frac{1}{2}$ inches in diameter, hairy on one side and not on the other, they weigh from 200 to 250 grains a piece. The small dark bags with the grayish hairs arranged evenly round the centre are the best. In the living animal the musk has the consistence of honey, is of a brownish-red color, and has a strong odour. When dry, the musk is almost solid, granular, and of a dark-brown color. It feels unctuous and fatty, has a bitter aromatic taste and its smell is powerful. Each sac does not contain more than 370 grains in an adult, and 123 in an old animal. Two kinds of musk are known in commerce, the Tonquin, or Chinese, which is the best, and the Habardui, or Russian. The musk that reaches Britain is imported from China in chests of from 60 to 100 ounces each. An inferior kind, of hill produce is imported from Bengal. There is also a Siberian or Russian musk. The Chinese musk bags are always observed to have been opened and sewn up again, and it is probable that adulteration is largely practised: the blood of the animal is often mixed with the musk. The Simla musk balls, which are presented as complimentary razars by hill chiefs, are an inferior kind, and do not command anything like the price of the genuine Tibet balls. About 100 musk bags are imported from Changthan via Yarkand of which about 40 go to Yarkand the rest go to Kashmir and Jammu, and are taken by Yarkandi pilgrims to Mecca for sale in India or other Asiatic countries: they are produced in the north-west of Rodokh and Nepal, and their value, at Le, 7 to 15 Rs, but all supply from that quarter has long ceased. In 1857, the import of musk into England was 10,728 ounces. The pod is obtained from the male, the largest are the size of about a pullet's egg and worth about 25

MUSK-DEER

shillings. Edrisi, the Moorish geographer, writing in the twelfth century, enumerates musk as one of the productions then exported from Ceylon, but this must have been the civet of the *glossy genet*, the civet cat of Europeans, which is common in the northern province, where the Tanul people confine it in cages for the sake of its musk, which they collect from the wooden bars on which it rubs itself. The musk bag of the musk deer consists of a sac, which is only present in the male, it is placed on the median line of the abdomen, between the navel and the outlet of the prepuce and near the latter. The sac is of a rounded oval form, flat on its superior and adherent surface, but convex and covered with hair on its inferior or free surface. In adults the sac is from two to three inches long, and 7 to 10 lines in depth. The envelope of the sac consists of three separate membranes. These small bodies are glands for the secretion of the musk. Toward the middle of the external surface of the sac is a short canal, which passes obliquely, and has its internal opening marked by a number of converging hairs.—O'Shaughnessy

MUSK-DEER

Moschus moschiferus | Ronz, The
Lig Liba or Lay, Trib

The musk-deer, is about the size of a young roebuck six months old. The color of the skin is blackish with a mixture of yellow and reddish brown. The tail has a heart-shaped space around it, naked in the male and always moistened with a strong smelling secretion, the females, during the whole of life, and the males up to two years of age, have the tail covered with hair on its upper part, and with wool on its under part: the animal has no horns. It is timid and nocturnal in its habits, very rapid in its course, it has a leaping motion, something like that of the hare, it leads a solitary life, except in autumn, it feeds upon the leaves, bark, and roots of trees, its flesh is good to eat. The male animal produces the musk, it is a native of Eastern Asia, between the 30° and 60° north latitude. It is found in the steppes of the Altai on the Irtysh river, extending eastward as far as the river Yenesei and lake Bukal.

The musk-deer is rather more than three feet long, and stands nearly two feet high at the shoulder, but they vary considerably in size, those found in thick shady woods being invariably larger than those on rocky open ground. The head is small, the ears long and erect. The male has a tusk depending from each upper jaw, which, in a full-grown animal is about three inches long, the thickness of a goose-quill, sharp pointed, and curving

MUSK-DEER

slightly backwards. The general colour is a dark speckled brownish gray, deepening to nearly black on the hind quarters, where it is edged down the inside of the thighs with reddish yellow. The throat, belly, and legs, are of a lighter gray. Legs long and slender, toes long and pointed, the hind heels are long, and as well as the toes rest on the ground. The fur is composed of thick spind hairs, not unlike miniature porcupine quills, they are very brittle, breaking with a slight pull, and so thickly set, that numbers may be pulled out without altering the outward appearance of the fur. It is white from the roots to nearly the tips, where it gradually becomes dark. The fur is much longer and thicker on the hind parts than on the fore, and gives the animal the appearance of being much larger in the hind quarters, than the shoulder. The tail which is not seen unless the fur is parted, is an inch long, and about the thickness of a thumb, in females and young animals it is covered with hair, but in adult males is quite naked, except a slight tuft at the end, and often covered, as well as all the parts near it, with a yellowish waxy substance. The musk, which is much better known than the deer itself, is only found in adult males, the females have none, neither has any portion of their bodies the slightest odour of musk. The dung of the males smells nearly as strong as musk, but singularly enough neither in the contents of the stomach, nor bladder, nor in any other part of the body, is there any perceptible scent of musk. The pod, which is placed near the navel, and between the flesh and the skin, is composed of several layers of thin skin, in which the musk is confined, and has much the appearance of the crop or stomach of a partridge, or other small gallinaceous bird, when full of food. There is an orifice outwards through the skin, into which, by a slight pressure, the finger will pass, but it has no connection whatever with the body. It is probable that musk is at times discharged through this orifice, as the pod is often found not half full, and sometimes even nearly void. The musk itself is in grains, from the size of a small bullet to a small shot, of irregular shape, but generally round or oblong, together with more or less in coarse powder. When fresh it is of a dark reddish brown colour, but when taken out of the pod and kept for any length of time, becomes nearly black. In autumn and winter the grains are firm, hard, and nearly dry, but in summer they become damp and soft. The musk-deer may be found upon every hill of an elevation above 8,000 feet, which is clothed with

MUSK-RATS' TAILS

forest. On the lower ranges it is comparatively a rare animal. Exclusively a forest animal, it inhabits all kinds of forest indiscriminately, from the oaks of the lower hills to the stunted bushes near the limits of vegetation the preference seems to be given to the brick forests, where the underwood consists chiefly of the white rhododendron and juniper.

The annual exports of musk from India were as under:

1857-58	£ 1,950	1859-60	£ 1,792
1858-59	.. „ 3,230	1860-61	.. „ 3,671

Nearly all of it was from Bengal, none from Madras, and in these four years only to the value of £132 from Bombay. A white musk deer is said to have been brought from Banka, of the size of a kitten, white all over, and apparently full grown — *Mackinnon's Shooting in the Himalayas*, p. 85-90. *O'Shaughnessy's Bengal Dispensary*, *O'Shaughnessy's Bengal Pharmacopoeia*, *Smith's Chinese Materia Medica*, p. 153. *Royle's Materia Medica Himala*, p. 269. *Cat. A fine cotton fabric, extensively manufactured in India, in Europe and America. There are a great variety of kinds and qualities, as, book-muslin, cambie-muslin, mull-muslin, &c. Formerly all muslins were made in British India, and Dacca in Bengal and Ainee in Chingleput were celebrated, Dacca, especially, was formerly celebrated for "its webs of woven wind." The Dacca muslin manufacture once employed thousands of hands, but towards the middle of the 19th Century it was quite at an end, so that it was with great difficulty that the specimens of the fabrics sent to the Great Exhibition of 1851, were procured. The kind of cotton (which is very short in the staple) employed, was hardly grown, and scarcely a loom then existed which was fit for the the finest fabrics. The Dacca

MUSLIN

jewellers still excel in gold and silver filigree. At the Madras Exhibition of 1855, the Cambie muslin bleached and the Isree muslin exhibited by Veerabomma Kistanna Chetty were of a very superior quality and the Jury considered the manufacturer entitled to a reward of a 2nd class medal. The most celebrated of Indian muslins was that of Dacca, made from cotton grown in the vicinity, the thread from which does not swell. *Chicacole*, and *Upada* a few miles north of *Cocanad* formerly produced the muslins and, in 1862, a strong muslin, generally checked, is procurable at *Chicacole*, at 3 to 6 rupees per piece of 8 yards, or made to order of very good quality at 11 rupees the piece. The famous *Ainee* muslins, of which *Book muslins* are an imitation, are prepared at *Ainee* in the *Chingleput* district, they sell according to quality. At the 1851 and 1862 Exhibitions, Dacca muslins stood successful in comparison with those of Europe, and in the Industrial museum at London is a piece 20 yards X 1 yard, weighing only 7½ oz. At that of 1862, an excellent specimen of Dacca manufacture was superior to any shown in 1851, the best specimen on that occasion proving to be of No 337s yarn and that of 1862 380s. As then, however, some machine made muslin in the Exhibition was superior in point of fineness, according to the mode of computation adopted, there were exhibited also,

<i>Charkina muslin</i>	<i>Ab rowan</i>
<i>Junglekhassa</i>	<i>Sircar i-Ah</i>
<i>Striped muslin, or Doo reah</i>	<i>Malmul Khas</i>
<i>Spotted muslin, or Bootee</i>	<i>Naynook</i>
<i>Alibully muslin</i>	<i>Figured muslin</i>
<i>Red spotted muslin, or Boote</i>	<i>Chanderkoora Malmul</i>
<i>Jamdahee</i>	<i>Kurnool muslin, 1st quality</i>
	<i>Maderpak muslin, from North Arcot</i>

The thread used in weaving muslin of the finest kind is spun from a peenhai kind of cotton, known by the vernacular name of 'Pu Parthi'. The weavers state that they purchase this thread ready spun from a colony of pariahs, who have settled in the neighbourhood, and who have the speciality of its preparation. It is not stated wherein this peculiarity of manufacture chiefly consists, as all that the local report says on this head is, that after the cotton is carefully cleaned and picked it is laid by in cloth bundles for two or three years, when it is rolled in plantain bark and then wound off. The weavers of the Philippines succeed in reducing the harsh filaments of the Abaca palm-tree, to such a degree of fineness, that they afterwards convert them into textures equal to the best muslins of Bengal.

of the exceedingly fine musk is slowly dying out. There is a demand for those of the finest quality—the best in our running-water and in our high-land. The Native nobility do not prize the finest sort, and there is no market for them elsewhere. In 1862, there was only a single lot of weavers in Dacca who could manufacture the very finest quality, and it takes them six months to make up one piece, but even for this piece they could find no orders. Besides, the particular kind of cotton, known, supposed to be finer than the best new Orleans staple, from which alone the thread was spun, is now never grown. The principal varieties of plain musk manufactured at Dacca, are Malinul Khis, Abirwan, Shab-nam, Khasa, Jhina Ghon Ali Tan-zab, Alahullee Nysook Baddan Khis, Tuandun, Sumbutee and Sumbund—names which denote fineness, beauty or transparency of texture, or the uses to which they are put. *Hooker Himal Jour* vol. ii p. 251 *Rhode, MSS M E J R* *Hutton's State* p. 55-6 *Cat Erh* 1862

MUSKITO

English,	HIND	Kosh,	Tan
Mosquitoes,	Moski	Dom,	Thi

Some writers have supposed the muskitoes to be the flies alluded to in Scripture, sent as plagues, but Bruce thought this Egyptian plague might be the Bomb of Abyssinia, and this is probably correct. Four species are known, *Culex lugens*, *C. fuscans*, *C. cinereolens*, and *C. regius*. A few sprigs of worm-wood placed about the pillow, will protect the sleeper from their attacks. To rub the worm-wood gently over the forehead and wrists, the best thing at hand, will repel the muskitoes or other insects, and give annoyance. These insects are most abundant near stagnant water, and in the low-lying rivers. Along the banks of the Irrawaddy, Burmese

sleeps under a musquito curtain the insects are so numerous. Their passage from a river or tank is intercepted by trees and at Kummendyne myriads hang about the trees. Captain Elphinstone Biskine also mentions that whenever the muskitoes were uncommonly numerous in Rewa (which was five miles from Niqué), he always used to be told that the boys had been disturbing the akan in namn. This tree was completely covered with muskitoes, and so thick were they, that one could easily have taken a cupful from any branch at one scoop. Every part of the tree, from the very top to the root, and in the same manner the branches, appeared to be one solid trunk composed of muskitoes. He was told by Thakouau that it had been so that since he was a boy, that it was the property of the tree to attract the muskitoes, and that, if never disturbed, the country would be entirely free from these troublesome insects. In India they are smoked out of a room by burning chips of wood. Various substances are employed by the Chinese to drive them away. On boardmen, says Fortune, who heard him talking about the musquito, asked Sing-Hoo why he did not buy some musquito tobacco, which they said might be had in the village, and which would drive all the muskitoes out of the boat. Immediately, he says, I despatched him to procure some of this invaluable substance. In a few minutes he returned with four long sticks in his hand, not unlike the pastilles commonly used for burning incense in the temples, only somewhat longer and coarser in appearance. They cost only two cash each—made with the sawings of resinous woods—procured, he supposes, from juniper-trees—and mixed with some combustible matter to make it burn. A piece of split bamboo, three or four feet in length, is then covered all over with this substance. When finished it is as thick as a rattan or a small cane. The upper end of the bamboo has a slit in it for hooking on to any nail in the wall, or to the roof of a boat. When once lighted, it goes on burning upwards until within six inches of the hook, beyond which there is no combustible matter, and it then dies out. A somewhat fragrant smell is given out during combustion, which at a distance, is not disagreeable. Sometimes the sawdust is put up in coils of paper, and is then burned on the floors of the houses. Various species of wormwood are likewise employed for the same purpose. The stems and leaves of these plants are twisted and dried, and probably dipped in some preparation to make them burn. The musquito

has a mortal aversion to all these substances and wherever they are burning, there the little tormentors will not come. I procured, he adds, the sticks in question, and burnt them daily, after this, and although the insects were often swarming when I entered the boat or an inn, the moment then "rovecio" was lighted they quickly disappeared, and left me to sit at my ease, or to enjoy refreshing sleep. A person informed him that they used the sawings of juniper or pine trees (pili heang fun, or sung shoo), Artemisia-leaves reduced to powder (mu-hin) tobacco leaves (cin fun), a small portion of arsenic (pe zu), and a mineral called mu-wang. To thirty pounds of the pine or juniper sawings, about twenty of Artemisia, five of tobacco, and a small quantity of arsenic were added. From subsequent inquiries, he ascertained the composition to be pine and juniper sawings, wormwood leaves, and tobacco-leaves, reduced to powder, a small portion of mu-wang and arsenic. Each article was well beaten up with water, then the whole mixed together, and in the form of a thick paste rolled on a slip of bamboo. On exposure to the sun the substance dried quickly, and was then put away for sale. When burned the sticks are somewhat like the common joss-sticks of the country, or about the thickness and length of a light walking cane. Another substance, much cheaper than the first, is found in every town and village in the central and eastern provinces of the empire, but no doubt it is in use over the greater part of China. Long narrow bags of paper—say half an inch in diameter and two feet long—are filled with the following substances, namely, the sawings of pine or juniper mixed with a small portion of mu-wang and arsenic. The proportions are thirty pounds of sawings, two ounces of mu-wang, and one ounce of arsenic. This mixture is not made up in the form of a paste like the latter but simply well mixed, and then run into the bags in a dry state. Each bag being filled is closed at the mouth, and then coiled up like a rope and fastened in this position with a bit of thread. Many hundreds of these coils neatly done up and placed one above another, may be seen exposed for sale in shops during the hot season, when mosquitos are numerous — *Davies' Chinese, Algiers in 1857, p. 15. MUSSORIE, HIND *Conium Nepalensis*, Wall.

MUSSOORIE or Masuri, a sanatorium or hill station, in the Himalaya, which adjoins Laddoo on the west and consists of a series of ridges about 5 miles in extent running off almost east and west with frequent peaks, and with spurs or shoulders issuing irregularly down to the valley of Deyali Dhoon on the south, and to the river Uglai or Uggulwar on the north, with deep wooded gorges between Banog, a hill to the west of the settlement has been ascertained to be 7,545 feet above the level of the sea and to be in 30° 28' 29" N lat and 78° 32' 3" E long. The river Jumna flows around the northern face of Banog and Badiay bounds the settlement of Mussoorie on the west. Mussoorie was first resorted to as a sanatorium in 1823. It is built upon heights varying from 6,400 to 7,200 feet, the majority of houses being situated at probably the mean elevation of 6,800 feet. There is no table land of any extent and almost every building stands on a site, which it was necessary to level either on a peak or ridge, on the southern slope of the mountains. There are few houses on the northern face. The buildings are generally a considerable distance apart, but they are closer together towards the east and in the centre than towards the west, which is the direction in which the settlement is extending. The view of the snowy mountains to the north, (which on a clear day appears to be within a few hours journey) and of the beautiful valley of the Dhoon, spread out like a painted map at the foot of the hills to the south, has been greatly admired. The river Ganges and Jumna are visible from many parts of Mussoorie not only as they foam over their rocky beds in their impetuous race through the valley but stretching far away into the plains. The sta-

MUSSULMAN

tion of Sabarunpore is also to be distinguished with a glass, bounding the horizon over the Sawalik range of hills which shuts in the valley of the Dhoon to the south. Comparisons have been made between Simla and Mussoorie to the disadvantage of the latter on account of the nakedness of the hills, or at least the want of forest trees, and particularly of the deodar which gives such a peculiar character to the scenery, at the first mentioned station. In January and February the weather is wintry always with frost more or less intense, and occasional falls of snow. In the course of March the frost entirely disappears, and many trees put forth their new leaves. Showers of rain, and sometimes of hail with thunder storms are experienced in this month and in April, after which till the setting in of the rains in the middle of June there is generally settled summer weather. The rains are considerably heavier than at the neighbouring stations of the plains. They cease on or before the 18th of September and are succeeded by a beautiful agreeable season, which lasts till Christmas, and sometimes till the middle or end of January. In this period of the year scarcely a closed door is to be seen and the temperature gradually sinks from 64° in the shade, in the beginning of October into that of sharp winter, the frost becoming strong in the course of November. The temperature of a spring on the north face of Mussoorie is nearly 54½° which may be assumed to be the mean temperature of the place and the mean extreme daily range (as determined by a thermometer in an open north verandah in March 1838), the most variable month of the year, was less than 5½°. Mussoorie is found to be 20° to 25° degrees cooler than the neighbouring stations.

MUSSOOR PURPOO, TAM *Ervum lens*.

MUSSUCK, or mushak HIND inflated skins, generally of bullocks and goats, used for carrying water.

MUSSULMAN, AR properly muslim, a person of the mahomedan religion, it is the plural form of the Arabic muslim. A woman is called muslimah and the creed Islam. There are, in British India, about seventeen millions of this faith, principally of Arab, Persian and Moghul descent, with many converts, however, particularly in lower eastern Bengal. They are of two sects, sunni and shiah Arabia, Persia, Asiatic Turkey, Central Asia, Egypt and Afghanistan, are largely mahomedan or mussulman. In European Turkey the mahomedans form about a sixth part of the population. The Afghans are mussulmans of the sunni sect with the

MUSTAJAR

exception of the tribe of Beritchee, who belong to that of the shirk. The Parsivan and Lemik, who are subject to the Afghans, equally, profess the faith of Islam but besides the two sets just mentioned some of them are of a third called Ah Illidze. The mussulmans or mahomedan sects are very numerous one of them is the Wahabi. Deirayh the Wahabi capital, is situated on the Wadi Beir Hattah, one of the defiles by which alone the Nephel-And can be entered. The Wahabi call, himself a Mu'ahhid, or Unitarian, in opposition to Muslark—Polytheism—in other sects but his own, and in Meccah follows out his two principal tenets, public prayer for men daily. The founder of this religion was Abdul Wahab a native of Arree a town in the district of El Ared. This man, in his youth, first studied at home the sciences which are chiefly cultivated in Arabia, he afterwards spent some time at Berr, and made several journeys to Bagdad, and through Persia. After having raised his native place, he began to propagate his opinions among his countrymen, and succeeded in converting several of them. Soon, whose subjects consequently, became followers of this leader. *Journal of the Asiatic Society, p. 291. Jahan Numa, p. 57. Bell's Travels, vol. 1 p. 5. Bell's Travels, vol. 1 p. 272. A. C. C. MUSSING, a river at Chien-mung

MUST, *Hind. Moddi*, *Sesuv.* a period of time, any day to which elephants are subjected to the rutting season, and during which it is not safe even for the mahout or driver to approach them.

MUSTA, *Hind.* A kind of yellow color in silk.

MUSTA, *Sesuv. Cyperus pinnifolius*

MUSTAKA, See Kairachi or Kairachi

MUS-PAGH, a name of the Kuen-lun mountain chain. Ak-su, a city of Chinese Tartary, lies to the south of the glacier pass, over the Mustagh in $L 78^{\circ} 55'$, $L 11^{\circ} 9'$, it contains twelve thousand houses, though Timkovsk counts the number more probably at six thousand. It stands at the confluence of the rivers Ak-su (white water) and Kok-shul, it is the central point of the Chinese trade, and from it diverge all the great routes toward China, the H country and the cities both of Eastern and Western Turkestan. *Yule Cathay, vol. 1 p. 572. See Kuen-lun, Mountain*

MUSTAJAR, *Ar.* A contractor

MUSTARD

MUSTAKAMU, or Tunga muste, *TEG Cyperus hexastachys, Rottl*

MUSTAKH, *Hind. Chenopodium*

MUSTAKI-ROOMI, *Hind. Mastic* The Mustagi-roomi, or mustagi of Amitsai is a Terebinthate resin, but the real mustagi-roomi is produced by the *Pistacia lentiscus* or *P. atlantica*—*Powell's Hand Book, vol. 1 p. 111*

MUSTANG, See Bungolzye, Kelat

MUSTARD, of commerce, is of a light yellow color. The seeds of both black and white mustard are first crushed between rollers, and then pounded in mortars. The pounded seeds are then sifted. The residue in the sieve is called dressings, or sittings, what passes through is impure flour of mustard. The latter by a second sifting, yields pure flour of mustard, and a second quantity of dressings by pressure, the dressings yield a fixed oil which is used for mixing with rape and other oils. Immense quantities of wheaten flour are employed in the adulteration of mustard, and many samples almost entirely consist of it. pea-flour is sometimes used. Out of fifty samples of mustard which Dr. Hassall submitted to examination he had not met with a single instance of adulteration with any other grain than wheaten flour. genuine mustard, whatever be the price paid for it, is scarcely ever to be obtained, forty-two samples submitted to examination were all found adulterated, the adulteration practised, in every case, was the same in kind, varying only in degree, and consisted in the admixture of genuine mustard with immense quantities of wheaten flour, highly colored with turmeric. Turmeric powder is the ground tuber of *Curcuma longa*, one of the Zingiberaceae, it is of a dark yellow color and consists of large cells, some of these are loosely imbedded in a reticular tissue, but others, and these the majority, are quite free they may be recognised with facility under the microscope by their size and bright yellow color. Although Dr. Hassall examined a large number of samples of mustard in no instance did he find turmeric powder absent. By some means or other probably by moisture and heat the turmeric powder is made to part with a portion of its coloring-matter to the flour which enters so largely into the composition of the mustard of the shops. Four qualities of mustard are supplied by the manufacturer. The first is called "second" it is usually of a bright yellow color, but is thickly studded over with numerous black or reddish-black points these are fragments of the husks of black mustard seeds. The next

MUSTARD OIL

quality is termed "fine," it also presents a considerable number of black specks, but fewer than in the former case. The third quality is called "superfine," it is spotted to a much less extent, although minute specks are still visible. The fourth, or best quality, is the "double-superfine," in this the eye can scarcely detect husk at all, although with the microscope, a little may still be discovered. These several qualities are vended to the public by a wholesale and retail establishment in the city of London at the following rates: "seconds," 5*d*, "fine," 8*d*, "superfine," 11*d*, "double-superfine," 1*s* 2*d*, per lb. The qualities of samples varied much—from "second" to "double-superfine." The price also varied greatly—from 1*s* to 2*s* the pound, the ordinary charge made being 1*s* and 1*s* 4*d* the pound.—*Hassall, Food and its Adulteration*, p 123. See Sinapis.

The black mustard is indigenous in almost every part of Europe and S Asia, its seeds are small and roundish, externally they are beautifully veined, and of a reddish or blackish brown colour, though sometimes whitish. Internally they are yellow. They are odorless, but have an acid oleaginous taste.—*Perena*.

MUSTARD SEED, White

Peh-kai,	CHIN	Sinapis alba,	LAT
Hu kai,	"	Kadoocoo,	TAM
Safed Rai,	GUZ HIND		

The white and black species of mustard differ only in the color and size of the seeds, the white mustard is yellowish, and much larger than the black seed. The properties of the white are less energetic than those of the black. In other respects they altogether agree. The white and black species of Sinapis of Linnæus, are the S nigra and S alba. The *vauv* of Hippocrates and Sinapis of the Romans. White mustard, sown round vegetables, as the cabbage, prevents the moads of caterpillars.—*O'Shaughnessy*.

MUSTELIDÆ

Mustard oil is expressed in various parts of India from the seeds of different species of sinapis, especially from the black mustard seed S glauca, S bichotoma, and S juncea, are also extensively cultivated in the east for their oil, and S alba, S arvensis, S nigra are also grown. The oil, as prepared from the seeds of different species of sinapis, is used in the northern parts of Hindustan, and in many parts of Malabar, for culinary purposes, in the same way as butter and ghee is on the Coromandel Coast. Mustard oil has of late been exported from Bombay to England and France. Five or six species of sinapis are cultivated in all parts of India, for the sake of the valuable oil they yield. Those most frequently seen are S glauca, S toria and S racemosa. The seeds of the "Sinapis alba" yield by expression 36 per cent of a bright yellow, pleasant tasted, edible oil, having a strong smell, and slight taste of mustard. The seeds of "Sinapis nigra," yield only 28 per cent of an oil in all respects similar to the above. The average price of mustard seed in eighteen large stations, in all parts of the Madras Presidency, for the quarter ending 31st October 1854, was Rs 1-2-8 per maund of 25lbs, the maximum being Rs 1-11-6 at Cannanore, and the minimum As. 10-5 at Nagpore. In Vizagapatam it costs Rs 208 per sicca garce. The oil is not exported from Madras, but the seeds have been shipped as follows:

1847-48	Cwt 5,828	1850-51	Cwt. 9,909
1848-49	" 6,767	1851-52	" 3,636
1849-50	" 9,435	1852-53...	" 16,075

It is used in most parts of India in cookery, and is considered superior to all other oils for anointing the body, which it is supposed to invigorate. In medicine, it is sometimes given internally, but is more frequently applied as a rubefacient.—*Amslie Materia Indica, Faulkner Commercial Dictionary, Madras Exhibition Jones Reports*.

name of the *Ficus Benjamin* tree, which always adorns the open plain in front of the houses of Javanese chiefs. Amulets, are, however, worn by almost all eastern nations. They are especially prized by mahomedans, of whom both young and old wear them. They are usually put on the young to ward off disease and to guard from the evil eye, and consist of figures with numbers on pieces of paper, or Arabic words, often extracts from the Koran, engraved on pot stone or silver or gold and worn from the neck. They are also put over the door porch or on the house wall—*Journal of the Indian Archipelago*, No VI—XII June—December 1853, p 274. Sec Charm, Nadoli.

MUSTUNG has a healthy climate and fertile soil. It contains no Afghans, the fixed inhabitants are Dehwai, mixed with the Raisan, Sherwani, Mahomed Shahi, Bangul-zye, Lari, and Supheria tribes of Giahui. The Bangul-zye exclusively occupy Ispringi, but reside also at Shall and Mustung and in winter repair to Talh near Lehli.

MUTHURA, Muthia or Mathura, a holy city of India, one of the most ancient places in Hindusthan. It is famous in the history of Krishna, as the stronghold of his enemy Raja Kaasa, and it is noticed by Arrian,

on the authority of Megasthenes as the capital of the Suraseni. Surasena was the grand father of Krishna, and from him Krishna and his descendants, who held Muthura after the death of Kansa, were called the Suraseni. According to Arrian, the Suraseni possessed two great cities, Methoras and Khisoboras, and the navigable river Jomares flowed through their territories. Ptolemy names the river Jomares, that is, the Jumna, and says that it passed between the towns of Methora and Khisobora. Ptolemy mentions only Muthura, under the form of Modura, *Μούρα*, to which he adds *ἡ τῶν θεῶν*, that is "the city of the gods," or holy city. In the seventh century the famous city of Muthura was the capital of a large kingdom, which is said to have been 5,000 li, or 833 miles, in extent. If this estimate be correct, the province must have included not only the whole of the country lying between the districts of Bhat and Agra, but a still larger tract beyond Agra, as far as Nowar and Siopuri on the south, and the Sindhu river on the east. Within these limits the circuit of the province is 650 miles measured direct, or upwards of 750 miles by road distance. It includes the present district of Mathura, with the small states of Bhmatpur, Kharoli and Dholpur, and the northern half of the Gwalior territory. To the east it would have been bounded by the kingdom of Jyotsna, and on the south by Malwa, both of which are described by Hwen Thsang as separate kingdoms. The city is surrounded by number of high mounds, several of which are no doubt old brick kilns, but many of them are the remains of extensive buildings, which having been dug over for ages in search of bricks, are now mere heaps of brick dust and broken brick. Taking Muttra as a centre the circle described by a radius of eighty-four miles would give the extent of ancient Viji, the seat of all that was refined in hindooism and the language of which, Viji-boli, was the purest and the most melodious dialect of India. In all Viji, the most classic spot is Bindabun. As the birth place of Krishna, Muttra is as sacred to the Vishnuvites as Bethlehem is to the Christians. A Dwapa prince had overthrown the Sena dynasty and re-established the aboriginal domination at Muttra. But Krishna was born in August, during the height of the rains. The most sacred spot in all Muttra is the Bismaghant, where Krishna and Buldeo rested from their labours of slaying Kansa, and digging his corpse to the river side. In Hwen Thsang's time there were only five brahminical temples in Muttra—in the

middle of the nineteenth century, there was only one Jain temple in Bindabun. Fa Hian and his companions halted at Muttra for a whole month during which time the clergy held a great assembly and discoursed upon the law. After the meeting they proceeded to the stupa of Sainptra, to which they made an offering of all sorts of perfumes, and before which they kept lamps burning the whole night. In Hwen Thsang's time the number of towers and monasteries was the same, but that of the monks had been reduced to 2,000. The king and his ministers were all zealous buddhists. In the Bismaghant is annually held a great barbing mela, or assembly, called Jumna-ki-Boorkee, on which occasion the gathering of men from Behar, Bundelund and other remote parts of India exceeds more than a hundred thousand. To the Chowbay race, the occasion proves a great harvest of gain. The pittances offered to the images of Krishna and Buldeo at the ghant sometimes amount to thirty or forty thousand rupees. The Greeks saw the Hindoos worship Bacchus in ancient Methora. This may possibly refer to, 'the curious Greek-clad statue,' which, with his portly carcass, drunken lassitude, and wine-wearied forehead, is considered by the antiquarians to be the 'well-known figure of the wine-bibbing Silenus.' The statue was discovered along with a Bacchic altar in 1836. It does not appear probable to have been worshipped by the buddhist or hindoo of olden time, and the way in which the question of its presence can most reasonably be solved, is to assume the residence of a body of Bactrian Greek sculptors who found employment for their services amongst the tolerant buddhists of the great city of Muttra, about the beginning of the christian era. Long has any buddhist or Greek god ceased to be worshipped in Muttra. The most favourite local deity now is Krishna, who is adored in nearly all the temples, abounding in the town which owns his exclusive jurisdiction. Contiguous to Muttra are those great sandstone quarries which for ages have furnished materials to the architects of Upper India for building the houses, shops, temples, and ghants of its principle cities. In Muttra, the ghants are light and graceful, in Benares, they are severe and simple. Buddhism in one shape or another, seems to have always existed in Muttra maintaining its ground under the modified form of Jainism, after the votaries of Sakya Muni had lost their footing.—*Cunningham's Ancient Geography of India*, p 373, 374. *The Hind* vol 11 p 22-44. See Viji.

MUTILLIDÆ, a genus of insects of the order Hymenoptera, comprising two genera Mutilla, and Tiphia

MUTINY, has occurred amongst the British Indian Army on several occasions In June 1764, the sepoys in the service of the E I Company mutinied for an increase of pay and bhatta, but Major Munro quelled the mutiny by blowing many away from guns In January 1766, the double bhatta was abolished It had been granted to the E I Company's Army by Mr Jaffin in gratitude for their services But on its abolition both officers and men mutinied, and it was only put down in fifteen days by the severe measures which Clive adopted In 1795, the Bengal officers broke out into open rebellion Its cause was Lord Cornwallis' abolition of all offices of gain in the military branch of the service The revolt was settled by the concession which Sir John Shore made to them Disaffection sprung up amongst the European officers of the Madras Army, in the early part of the nineteenth century, with whom a few regiments of sepoys sympathized, but it was quickly subdued About the year 1824 at Bariackpore disaffection was again manifested In 1857 the greater part of the army of Bengal and several Regiments of the Bombay Army revolted The first signs occurred near Calcutta but the revolt continued by the outbreak of the native cavalry at Meerut, on the 10th May 1857, and before the end of

MUTTALLA

1857 nearly all the Bengal Army, with several regiments were swept away, but before this could be done, many of the predatory tribes and numbers of the civil population engaged in the rising, and a rebellion of nearly all Upper India was the result The Sikhs of the Punjab greatly aided in re-subduing the populations Disaffection occurred amongst the European soldiers of the E I Company's Army, on the 2nd May 1859 which resulted in about 10,000 soldiers taking their discharge

MUZARI, a wild predatory tribe of Baluch, on the western bank of the Indus near Shikarpore who submitted to Sir A Buines at Khyipore They rode mares in their chupaos or forays The Muzaree; formerly dwelt in the hills, but migrated to the plains where they have since remained, and have been a thorn in the side of successive governments They can muster 1,000 fighting men, and more than a hundred horsemen Their head-quarters are now at Rojha below Mithunkote, and near the confines of Sind When Mithunkote was conquered by the Sikhs, they harassed the new-comers and laid waste the acquisition The vicinity of Mithunkote still bears traces of desolation A strong Sikh force moved against them, and thus the lower extremity of the Derajat, down to Slawullee, was then added to the Sikh dominions, and at annexation became included in British territory Maharajah Runjeet Sing subsequently received the Muzaree chief at Lahore The Muzaree are not disloyal subjects, and aid in keeping the Muzaree in check, against whom they are bitterly opposed But they are unfortunately addicted to cattle-lifting In fact they carried on more or less an organized system of theft, not only in British territory on both sides the Indus, but also in Bahawalpore territory To prevent this, the formation of river police was commenced, and then depredations diminished See Khayber

MYURA Hwen Thsang describes the town of Mo-yu-lo, or Mayura, as situated on the north-west frontier of Madawar, and on the eastern bank of the Ganges. The vicinity of Ganga-dwara, or the Ganges gate, which was the old name of Haridwar or Gate of Hari, shows that Mayura must be the present ruined site of Mayapura, at the head of the Ganges canal. But both of these places are now on the western bank of the Ganges, instead of on the eastern bank, as stated by Hwen Thsang. The name of Haridwara, or "Vishnu's Gate," would appear to be comparatively modern, as both Abu Rihan and Rashid-ud-din mention only Ganga-dwara. Kalidas, also, in his *Meghaduta*, says nothing of Haridwara, although he mentions Kankhal, but as his contemporary Amarasinha gives Vishnupada as one of the synonyms of the Ganges, it is

certain that the legend of its use from Vishnu's foot is as old as the fifth century—*Cunningham's Ancient Geography of India*, pp 351-353. See *Ganges*, *Gangotri*

MYAS HORMUS Gibbon says every year about the summer solstice, a fleet of 120 vessels sailed from Myas Hormus, a port of Egypt on the Red Sea. The coast of Malabar, or the Island of Ceylon, was the usual limit of their navigation, and it was in those markets that the merchants from the more remote parts of Asia expected their arrival. Mr Gibbins has pointed out that in classical days the extremity of the peninsula was the entrepot of commerce between the east and the west.

MYEN-MO BURM In Burmese cosmology, the great mountain, Maha-Mein, surrounded by its seven concentric and graduated rings in the centre of this Sakwala or Mammee system, which again is encompassed by a circular wall of rock called the Sakwalingdi. One of the Burmese legends, at the termination of them Wat or Lent, is called Tse-mee-myen-mo, or Myen-mo lamp lights. The streets are illuminated and in them are exhibited high round structures, to represent Mount Myen-mo covered with little figures of its spiritual inhabitants. This enormous central mountain is several millions of miles high, round which, according to the Burmese theory of the solar system, are firmly fixed ten great islands, on the southern of which Asia and Europe are situated, the sun which lights them revolving round the central mountain. Mount Myen-mo mountain forms the centre of the Sakwala or Sakha system of cosmogony. One of the four great islands which surround it is Jambudipa, the world we live in — *Yule*, p 172

MYGALE AVICULARIA, builds a strong white web and Mr Bates found two females involved in it, one dead, the other dying. Madame Merlan, in a work on the insects of Sumatra, published in 1705, figured the Mygale avicularia, in the act of devouring a humming bird. The accuracy of her statement has since been impugned by a correspondent of the Zoological Society of London — *Eub's Nat on the Animals*, vol 1 p 161

MYGALE FASCIATA, a Ceylon spider, the limbs of which, when expanded, have a diameter of 6 to 8 inches. By day, it remains concealed in its den, whence it issues at night to feed on larvae and worms, cockroaches and then pupa, its food consisting of soft insects and annelides. It makes its nest in walls, trees, or sheltered by stones. It is lined throughout with a tubular silk tapestry, so fine and closely woven as to be water-tight, and at its mouth is a little platform stayed by braces. In the rainy

MYLABRIS

season the platform is extended so as to form an awning. The Mygale fasciata is not only sluggish in its habits, but disgusting in its form and dimensions. Its colour is a gloomy brown, interrupted by irregular blotches and faint bands (whence its name), it is sparingly sprinkled with hairs, and its limbs, when expanded stretch over an area, of 6 to 8 inches in diameter. It is familiar to Europeans in Ceylon, who have given it the name, and ascribed to it the fabulous propensities of the tarantula. This hideous creature does not weave a broad web or skin, a net like other spiders but nevertheless, it forms a comfortable mansion in the wall of a neglected building, the hollow of a tree, or under the eave of an overhanging stone — *Tennent's Sketches of the Nat Hist of Ceylon* p 465 to 467

MYLABRIS, a genus of insects of the order Coleoptera, possessing properties identical with those of the blistering beetle *Cantharis vesicatoria*. The ancients chiefly employed two species of Mylabris, one of which, the Melichon, the telum of the hindoos, has been used for ages, and is so at present by the European and native physicians of India and China. The blistering flies of India are chiefly the Mylabris or Meloe cichon, the *Cantharis gigas*, and the *Cantharis violacea*

MYLABRIS

The Meloe or Mylabris eichorn is common in the neighbourhood of Dacca, in the Hyderabad country, in Kurnool, and numerous other localities. The insect is about an inch long, and one-third broad, the elytra or wing covers are marked with six cross stripes of deep blue and russet brown. The Buprestis of ancient writers is met with in the bazars under the name of the golden fly (sonamukhi). The Cantharis violacea is often mixed with specimens of Meloe in the bazars. The Telini fly, if procured before the mites have commenced its destruction, yields on an average, one-third more of cantharidin than the Spanish fly of the European shops. The blue fly is of uncertain strength, the Buprestis in all the specimens obtained, was quite inert. A species of Meloe called the M trianthema, from its being usually found on the plant named Trianthema decandrum (biscopia, Hindi) was described by Dr Fleming. A tincture, acetous tincture, plaster, and ointment of the Meloe eichorn are described in the Bengal Pharmacopoeia. Some prejudice exists against the article on account of its alleged excessive severity of action. This is solely owing to the presence of a greater quantity of cantharidin than that contained in the common fly. Diluting the tincture, and adding to the proportion of lard and wax in the plaster and ointment, perfectly assimilate the action of the indigenous and the imported insects. At the Madras Exhibition of 1855, specimens of the Indian blistering beetles, Mylabris pustulata, and M punctum were exhibited by Dr Collis of Pondicherry, these were accompanied with a full and interesting report on their blistering properties printed in the "Monteur Official" of 2nd March 1855. M pustulata, and M punctum are found in large quantities at certain seasons all over Southern India. The official Blistering Fly has had a variety of names. It was called Meloe vesicatorius by Linnæus, Lytta vesicatoria by Fabricius, and Cantharis vesicatoria by Geoffroy, and now by the Pharmacopœias. The name χανδαπια was applied by the Greeks to a species of Coleopterous insect which possessed the properties of the official blistering beetle, but it was distinguished by yellow transverse bands. This is the characteristic of species of Mylabris, one of which, M Fusseleri, occurs in the south of Europe, and another, M eichorn throughout the east. In India it is called telee or telini, and telee mukhee, or the Oily Fly, from the oil-like exudation which the insects of this genus give out from the articulations of their legs when seized. Another species, M trianthema, is mentioned by Dr Fleming, and the Lytta gigas Fab is

MYMENSING

found in India as well as in Senegal. One is mentioned by the Arabs under the name of zamach. Mylabris eichorei and M pustulatus are used by the Chinese. About 180 lbs forwarded in 1860 from Bombay by Dr Budwood to test the market value in England, were sold at 5s 3d per lb—*Royle, O'Shaughnessy*, p 681, *M F J R Cat Ex* 1862 *Dr Hunter, Tr Bengal Soc* vol 1 p 216 *Smith Mat Med of China*

MYRICA CERIFERA, the Candleberry myrtle abounds in the Bahama islands and might be introduced into India. The shrub produces a small green berry, which, like the hog plum, puts out from the trunk and larger limbs. Much patient labor is required in gathering these berries, and from them is obtained a beautiful green wax, which burns very nearly, if not fully, as well as the spermaceti, or composition candles. The method of procuring this wax is by boiling the berries in a copper or brass vessel for some time. Iron pots are found to darken and cloud the wax. The vessel after a sufficient time is taken from the fire, and when cool the hardened wax, floating on the top of the water, is skimmed off.

MYRICA CORDIFOLIA The wax tree of Louisiana contains immense quantities of wax. According to the experiments of M Cadet and Dr Bostok, myrtle wax differs in many respects from bees' wax. Specimens of it assume shades of a yellowish green color. Its smell is also different, myrtle wax, when fresh, emitting a fragrant balsamic odor. It has in part the unctuousity of bees' wax, and somewhat of the brittleness of resin. Its specific gravity is greater, inasmuch that it sinks in water, whereas bees' wax floats upon it, and it is not so easily bleached to form white wax. The wax of the *Myrica cordifolia* of the Cape, is used for candles—*Simmonds O'Shaughnessy, Bengal Dispensatory* p 612

This tree occurs in different parts of the Himalaya from the Sutlej to Nepal and Silhet, fruit agreeably flavoured. The same,

MYRISTICACEÆ

or a nearly allied species, is found in China and Japan, in the Sutlej valley between Rampur and Sungnam. Fruit used for making sherbet. The fruit is edible, with a sweetish bitter taste. It ripens in June. In the Himalaya it is generally met with at an altitude of from 4,000 to 6,000 feet, and its bark is exported to the plains as a dye and as medicine. On the lower Sutlej, it is common, and a few trees may be seen at from 3,200 to 6,000 feet up to the Ravi. The bark is aromatic and stimulant, and a favorite native medicine. The fruit has not much flesh, but is a pleasant sour sweet. It is mostly used in sherbets. The bark is official in the plains, being considered hot, and given in rheumatism, and mixed in plaster—*Dr J L Stewart, M D Powell's Hand-book*, vol 1 p 314 *Cleghorn Punjab Rep* p 65—*Hogg Vegetable Kingdom*

MYRICARIA ELEGANS, Royle

Hunab, umbu, of Sutlej, and Ladak

This is one of the Tamariscinæ. Dr Stewart found it at 9,000 feet sparingly on the Sutlej, and it grows from 10,000 feet on the Upper Chenab to 15,000 in Ladak. The leaves are often covered with a saline efflorescence, in Lahoul its leaves are applied to bruises, &c. The twigs are in Ladak browsed by sheep and goats.

Jae putri,	DUK		

A tree with small, pale yellow, and odorous flowers, successfully cultivated in Sumatra, Bencoolen, and Penang The girth is 6 to 10 inches, a foot above the ground It branches like the laurel and its loftiest sprays are frequently fifty feet high The fruit when ripening resembles a peach, and on removing the epicarp or fleshy outer rind, is a spherical nut, black, clasped by a fine branching ail, of a vermilion colour, which is the mace of commerce When ripe the fruit is picked, the outer part removed, the mace taken off and dried in shallow baskets in the sun The nut contains a volatile, as well as a fixed oil The wood is said to be hard and close grained, the culture of the nutmeg tree has been successfully commenced both at Meigu and Maulmain Behind the hill at Maulmain, the trees appear to thrive, and at Meigu the trees were thriving Nutmeg butter is prepared by beating up the nutmegs, enclosing the paste in a bag and exposing it to the vapour of water, and afterwards expressing the fat by means of heated plates The nutmeg tree is monocious as well as dioecious, but no means exist of discovering the sexes, before the period of inflorescence, is known Upon an average, the nutmeg tree fruits at the age of seven years, and increases in produce till the fifteenth year, and is said to continue prolific for sixty or eighty years Seven months in general elapse between the appearance of the blossom and the ripening of the fruit and the produce of one bearing tree with another, under good cultivation, in the

fifteenth year, may be calculated at five Pounds of nutmegs, and a pound and a quarter of mace. It bears all the year round, but more plentifully in some months than others, and generally yields more abundantly every other year. It is necessary that the roots of the trees during their growth should be kept well covered with mould, for they have a tendency to seek the surface. The growth of the lateral branches is to be alone encouraged, and all suckers, or dead and unproductive branches, are to be removed with the pruning knife, and the lower shoots lopped off, with the view of establishing an unimpeded circulation of air."

The *arillus* or mace is thick, between horny and fleshy, much lacerated, folded and anastomosing towards the extremity, almost enveloping the nut, when fresh, brilliant scarlet, when dry, more horny, yellowish brown and brittle. The smell and taste of the *arillus* are peculiarly fragrant and agreeable. It softens, but does not dissolve in the mouth. Beneath the *arillus* is found a bony shell, which covers the almond or kernel, this shell is thin, hard, brittle, brown and shining above, pale grey within, insipid and inodorous, and encloses the nutmeg of commerce.

The *kernel* is large, rounded, obtuse at both ends, the size of a small myriobalan nut, smooth, marked with reticulated chinks, those transversely placed being less evident than the longitudinal, grey externally. In the chinks occurs a whitish powder, apparently chalk, internally the almond is traversed by branching, reddish, irregular greasy veins, giving it a marble appearance. The nut is hard and easily cut, scraped, or grated, very inflammable, but the smoke is devoid of the fragrance of the acid. The odour of the nutmeg is most agreeably aromatic, its taste hot, and analogous to the smell. The nut readily divides under the teeth, and is partially soluble in the saliva. Nutmegs are much injured by time, becoming the prey of insects, which perforate them in every direction, sometimes good nutmegs are adulterated with others from which the valuable principles have been extracted by alcohol. Worm-eaten nuts are also fraudulently repaired by the introduction of a paste of flour and nutmeg oil into the holes.

The *Essential Oil of Nutmegs* is white, lighter than water, acid, pungent taste, and very powerful nutmeg odour.

The *Fixed Oil*, or *Butter of Nutmegs* occurs in the commerce of Europe in flattened masses, of square form, yellowish, solid, internally marbled, 500 parts containing about 50 of essential oil. This substance is much adulterated, particularly with snet, sper-

maceti, marrow, wax, the oil of the *Moringa pterygosperma* coloured with alkanet or rocou, &c, &c. The fixed oil is obtained by bruising the nutmegs into a paste, which is compressed in bags between hot metallic plates. Two kinds are found in commerce—one in small earthen pots, of mace colour, and very agreeable smell, is exported from the Moluccas, to Holland chiefly, the second kind is obtained from Holland, occurs in flat cakes, is far inferior to the first, and is usually adulterated with spermaceti. The chief use of nutmegs is as a spice, and for the preparation of perfumes and scented soaps. The tree, according to M. Jce, was altogether unknown to the ancients, and *Kewar* of Theophrastus and the *Cinnamomum* of Pliny have been erroneously regarded as identical with this. *Avicenna* seems to have been the first who described it under the name "*Jambou*." The tree itself, however, has only been identified clearly within the last few years. The nutmeg tree is chiefly cultivated in the Banda islands, but plantations are now numerous at the Mauritius, Bourbon, Cayenne, Martinique, and in the English possessions to the Eastward, especially in Province Wellesley, Penang, and also in the Tinnevely district of Southern India. The natives of the Moluccas gather the nutmeg fruit by the hand, strip off and reject the pulpy pericarp, detach the mace carefully, and expose it to the sun, which soon changes its blood-red colour to a light brown, it is then sprinkled with sea-water to render it flexible, and to preserve it. The nuts are first sun-dried, and then smoked, until the kernel rattles against the shell. This envelope is then broken, and the kernels dipped twice or thrice in lime-water. They are then heaped together for two or three days, wiped, and packed in bales or barrels. The nutmegs thus prepared have been long termed, "female," or "cultivated," in commerce, to distinguish them from a kind named the "wild" or male, which is less esteemed, and seldom found in European trade.—*Bilmore* 223. *Penang Gazette* *Ridell* *O'Shaughnessy*, pp 535, 536. *Amslies' Mat Med* p 264. *Royle Mat Med* *McCulloch's Commercial Dict* p 852. See Nutmeg.

MYRISTICA OTOBA

Viola sebifera, *Lamarck* | *Myristica sebifera*, *S. Fe*

A large tree of Cayenne and Guiana yields aromatic nuts which when boiled with water give out a large quantity of a fixed oil, used for making candles. An acid juice also exudes from incisions in the bark, and is employed as a popular medicine.—*O'Shaughnessy*, p 537.

M malabarica, Lam | Male nutmeg tree, Eng

A tree of the Moluccas, Malabar, S Concan Small yellowish flowers

The fruit is downy, its substance fleshy more solid, and firm The kernel is covered by a hard shell provided with a pale arillus, the kernel is $1\frac{1}{2}$ to 2 inches long, elliptical, the parenchyme devoid of mairblug Its odour is weak, flavon disagreeable The mace of this nutmeg is distinguished from the true mace by being formed of three or four regular bands united at the summit The chemical composition of the article is analogous to that of the true nutmeg, but the oils are so inferior in proportion, that the "male" nutmeg is but of little commercial value in Penang, its fruit is used as a substitute for the true nutmeg—O'Shaughnessy, p 537

MYRMELEON GRAVIS, Walker, one of the ant-lions of India whose larva have earned a bad renown from their predaceous ingenuity Ceylon has, at least, four species, which seem peculiar to the island, viz, Palpaes contrarius, Walker, Myrmeleon gravis, Walker, M dnus, Walker M barbarus Walker The form of the larvæ at the lower part resembles that of a spider, but the head is armed with a sharp strong pair of claws They excavate, in fields, gardens and roadways, small cup shaped cavities, with exquisitely smooth edges and sides, at the bottom of which they lurk, so that any insect approaching near, immediately falls below to the ambush and is seized and destroyed Their excavations are usually carried on at night, but in the

MYRMICIDES

process they throw up the sand and gravel to a considerable height, the soil around their cups is very level They often throw up a particle of sand towards any adhering insect, which, by moving the mass, brings down the insect with it One of the huge black ants was seen to fall into one of the cups, and was seized by the ant lion, but its comrades adhered to the captive to release it—Walker in Tennent's Sketches of the Nat Hist of Ceylon, p 411

MYRMICIDES A tribe of insects comprising the ants

The genus Atta, comprises 6 species of ants, all of small size, having a sting, two knots in the first segment of the abdomen, antennæ not concealed in a cleft, thorax without spines, and short palpi

Atta minuta, Jerdon Worker, barely 1-12th of an inch long, head oblong This minute species makes a temporary nest in various situations, in any empty box, between the back of a book and its leaves, even among the loose pages of a book, in an empty shell, &c &c Nothing is used in its construction, a shelter from the light merely being sought for It is perhaps not very numerous in individuals, one wingless female is generally found in the nest It is very common in the Carnatic and most parts of India, but not seen in Malabar It appears to prefer dead animal matter to saccharine or vegetable products

Atta destructor, Jerdon Worker, about 1-10th of an inch long, head oblong, not so long in proportion as in the last, eyes small, colour rufous, abdomen glossy brown They live in holes in the ground, or in walls, &c, and are very numerous in individuals They prefer animal to vegetable substances, destroying dead insects, bird skins, &c &c, but also feed greedily on sugar They are common in all parts of India, and often prove very troublesome and destructive to the naturalist

Atta domicola, Jerdon Worker about 1 6th of an inch long, head oblong, eyes moderate size, head, thorax, and legs, deep red brown, abdomen blackish This species of ant does not seem to be common, only hitherto procured at Nellore in a hole in a house and only one kind of individual seen

Atta rufa, Jerdon Worker, 1-8th to 1-6th of an inch long, head short, oblong, eyes rather small, medial, of an uniform glossy rufous colour, with the end of the abdomen somewhat darker Worker variable, about $\frac{1}{4}$ th inch long, head large, very square Female about 7-24th of an inch long It is very

common in Malabar, also found in the Carnatic in holes under ground, about gravel walks, mud walls, and often appears in houses, coming through a hole or crevice in the floor, or wall. From a colony of them, every row and then, vast numbers of winged females, (and males) issue forth just before sunset attended as far as the window by swarms of the neuters of both kinds. Its favorite food is dead insects and other matter, but it also carries off seeds, chaff, &c &c like the *Ocodoma*. It stings very severely, leaving a burning pain that lasts for several minutes.

Atta dissimilis, *Jerdon*. About 1-10th of an inch long, head oblong, abdomen long, oval, colour blackish throughout. This ant is found in small numbers on trees in Malabar.

Gen. *Myrmica*. Antennæ sufficiently exposed, head triangular, without spines, maxillary palpi long, of six joints, jaws triangular, three cubital cells in the upper wings, the third incomplete, &c.

Myrmica diffusa, *Jerdon*. Worker, rather more than 1-9th inch long, head and body rufous, abdomen dark glossy brown. Female

length 5-12th of an inch wings not so long as abdomen. Male—, head very small, eyes large, length 1-7th of an inch found throughout India. It makes its nest in holes in branches of trees, runs with its abdomen turned upwards almost over its head, especially when excited, and feeds on honey and other vegetable secretions. Occasionally they appear to form their nest among the roots of moss, orchideæ, and various epiphytic plants, at least this is the case in Malabar. It is very pugnacious, and bites very severely, not appearing to use its sting much.

Myrmica rufa, *Jerdon*. Worker, length 9-48th of an inch, entirely of a rufous colour. This is a very closely allied species, and is found in the same localities as the last. Its habits are similar.

Myrmica Kirbyi, *Sykes*? head, thorax and legs dark maroon, abdomen dark brown. Length 7-48th of an inch, found chiefly in the elevated forests of the Wynad. It forms a considerable nest of some papyraceous materials, usually of an oval form, and placed round a small branch which supports it. It is very numerous in individuals, countless swarms issuing from it on being disturbed and boldly attacking the assailants both with teeth and sting. It feeds on honey or flowers and other vegetable secretions. The nests are built on different kinds of trees and shrubs, the *Syzygium jambolana*, *Coffea Arabica*, *Psidium*

pomiferum, *Citrus aurantium*, &c. A nest taken from a *Syzygium jambolana* at Nagalore, Shivaroy Hills, weighed 3lbs 8oz, irregularly oval in form, extreme length 19 $\frac{1}{2}$ inches, girth or circumference in the centre, 32 $\frac{1}{2}$ inches, and sufficiently solid to withstand moderate force. The nest was situated about 30 feet from the ground, on a fork of the tree, and was built round some of the branches, which protruded through it in various directions, the girth of the thickest or lowermost branch of the fork measured 1 $\frac{1}{2}$ inch, all the other branches that protruded through the nest were much smaller. The structure was made up of a fine mixture of cowdung and leaves of various kinds, but the outside was well smeared with cowdung, and honeycombed with tile-like appendages, which whilst they permitted the free ventilation of the interior, at the same time, by a slight projection of the scale-like leaves, rendered the nest impervious to rain. These diminutive creatures put on, threatening attitudes with their abdomens flexed over their back or thorax, and their mandibles extended. They ran to and fro in a state of excitement in search of the enemy, on whom, when found, they at once advanced, and used their expanded jaws to such purpose as to cause extreme pain to the individual attacked. Considering their small size, the ferocity and undaunted courage they exhibited, and their readiness to attack man or beast who approached them were very remarkable. A battle had taken place between the inhabitants of two nests, numbers even in death clinging to each other and the survivors were but few in number. The victors were already busily engaged in plundering the nest of the vanquished of its cocoons, and carrying them off to their own.

Myrmica tobens, *Jerdon*. Worker, length 4-12th of an inch head, thorax, legs and abdominal pedicels maroon colour abdomen shining brown. Female, head rather smaller proportionally. This is one of the most common and abundant ants in Malabar, not seen in the Carnatic. It seldom enters houses, it otherwise appears to take the place of *Formica indefessa*, which is not found in Malabar. It feeds chiefly on honey and other vegetable secretions, but also will take dead animal matter. It is also found in the train of caterpillars feeding on leaves. It makes large excavations under ground, generally having the entrance round the trunk of a tree, and it forms considerable heaps of fine earth round the mouth of the nest. It runs with its abdomen turned downwards under the abdominal pedicels.

Myrmica tarda, *Jerdon*. Worker, length

MYROBOLON

1-6th of an inch, head, thorax, legs abdominal pedicles, black red, abdomen dusky, dark blue This very curious looking ant, is found both in the Carnatic and Malabar, lives in holes in the ground in small societies, and feeds on vegetable secretions It moves very slowly

Myrmica ecoca, Jerdon *Ocodoma*? Worker, length 1-5th of an inch, head, thorax, and legs reddish brown, abdomen glossy brown, found once under a stone in the Wynaad—Dr Jerdon in *Madras Lit Society's Journal* A brief account of the *Myrmica Kribi* as found in Southern India, By John Shortt M D, F L S in *Linnæan*

MYROBOLON, also myrobolan and myrobalan The substances known by this name are the fruits of several East Indian trees, and are used in India as substitutes for galls When ripe, the fruit is pear shaped, deeply wrinkled, of a brownish, yellow colour, and weighs from 70 to 100 grains The husk contains the whole of the astringent matter, some mucilage, and a brownish yellow colouring substance, which is used in India for dyeing yellow The husk is usually separated by bruising the nut, which it encloses The tannin of myrobolans differs slightly from that of galls Gallic acid is present in rather large proportion The price of myrobolans in June 1852 was quoted at from 5l, to 10l per ton, 8s to 12s the cwt Six kinds of Chebulic myrobolans all known as Hehlel are used in India Hehlel-Zina, the fruit is dried when just formed, and the size of a cummin seed or Zina H-1-Jawi, the fruit dried when the size of a jao, or barley-corn H-1-Zangi, the fruit dried when of a larger size and black like a negro H-1-Chini, larger than H-1-Zangi, and greenish H-1-Asfar, the fruit near maturity and yellow (Asfar) H-1-Kabul, the fruit at full maturity Mature Cabul myrobolans sell for a rupee a piece in the Bombay market, under the name of Saiwai-i-Hind

The Unguent corn or Myrobalan of Pliny, the *βαλανος* of Theophrastus and the Greeks referred to a species of *Moringa*, probably *M aptera* of Africa and Arabia, though *M pterygosperma* has been named

The Myrobolans of commerce yielded by the *Terminalia chebula*, *T belerica* and *T citrina* are called also gallnuts and are oval fruits of a dingy yellow colour, containing much tannin, hence, they are useful to the tanner as well as to the dyer With alum, this fruit yields a good durable yellow, and with salts of iron, a black colour, little inferior to that produced by oak galls The myrobolans although a very common dyeing

MYROBOLON

and tanning material of India from time immemorial, have not been many years introduced into European commerce but successful have they been found, that, by the year 1852, they had become a very important article of trade, and the consumption rose to fully 2,000 tons annually On this subject, the Canara Local Committee, writing in 1855, observed as follows — 'During the last season a sudden demand arose for the gallnut, (myrobolan) and large profits were made by the persons who collected it from the jungles The exports for five years had been as follows' —

Fusly 1256	Candies 207	Mds 3	Rs 918
1260	380	16	1,877
1261	537	19	2,860
1262	530	17	2,614
1263 ..	2,154	4	3,029

In 1853 4 the exports from Madras were 4145 cwt value Rs 8,447

All the three myrobolan trees are to be met with throughout India In Bengal they grow in abundance In Java, we are told by Buntius, that the Dutch were in the habit of employing the emblic and belerica sorts daily in their hospitals, in dysentery, and bilious affections

Har or Haria, from *Terminalia chebula* and other species, three in number, comprise all the discarded myrobolans of the old pharmacopæas

The myrobolans as brought into Cashmere from Delhi and Harowtee, Hindustan and the Dukhan, are of four kinds namely

Gural haria — Astringent and purgative used in mesalhis given in medicine to children four seers for one rupee

Jurwal haria — Used in the same way eight seers for one rupee

Chapel haria, used only in dyeing ten seers for one rupee The whole are much used in dyeing According to the size of the myrobolan its value augments, so that a very large one may be worth one hundred rupees or more, the natives believing that the very large ones have the virtue of causing purging by being merely retained in the hands The Har or Haria, says Dr Irvine, is one among the articles of the native materia medica than which no one is more vaunted It is considered to possess wonderful general deobstruent and purgative qualities, &c, &c while those who thus belaud it, are apparently not aware that this is the chebulic myrobolan (*Terminalia chebula*) of English pharmacopæas of the sixteenth century and long since described by

The bellerie myrobolon, is the fruit of the *Terminalia bellerica* in its dried state, is little larger than a gall-nut, but not so regular in shape, of a dirty brown colour, and astringent taste. It is supposed to be similar in its properties to the chebulic myrobolon, but in a much weaker degree. It is much used in India as the basis of several colours, and also in medicine. Small quantities have of late years been exported from Bombay to Britain. This article is sometimes used by the natives in its dried state in cases requiring slight astringents. The large tree which produces it is common in Mysore, where it is called Tam — *Paulkner Ainslie's Mat Med* p 28 *Mason*

The myrrh of commerce is believed to be produced from several trees, Balsamodendron gileadense Kunth, the Balsam of Bruce and a synonym of Amyris opobalsamum, Forskal, and of Balsamodendron opobalsamum

The Balsamodendron myrrha of Nees, the Karbeta of the natives, seemingly identical with B Kua of Mr Brown's MSS

Myrrh is mentioned in Gen xxxvii v 25, and in Exod xix 23, by the name of Mor or Mur. The Greeks called it *μύρρα*, and also *συμύρρα*. Herodotus mentions it as produced in the south with Frankincense, &c. Dioscorides states the variety called Trioglyptea to be the best. In the Periplus of the Red Sea, Arrian mentions myrrh with olibanum as exported from the coast of Barbana, that is, the modern Berbera. Bruce learnt that it as well as Frankincense, was produced, in the country behind Azab, or in that of the Dankil. The embassy to Abyssinia under Major Harris met with it on the hills, in the comparatively flat country which extends from Abyssinia to the Red Sea, near the Straits of Bab-el-Mandeb, or from the Dooni Valley to the

banks of the Hawash. Mr Johnston (Trav p 249) met with it in nearly the same locality. Both authors describe the myrrh as exuding from wounds made in the bark, and say that it is collected in January and March, but chiefly in July and August, and in small quantities at other times of the year and exchanged for tobacco with the merchants who proceed to Berbera, &c, whence it is exported to the coast of Arabia

Myrrh reaches Europe chiefly from Bombay, having been imported there from the Arabian and Persian Gulfs. It used formerly to be obtained also from Turkey. Ehrenberg and Hemmich found a small tree in Arabia near Gison, on the borders of Arabia Felix, from off which they collected some very fine myrrh

The Balsam of Bruce was found by him at Azab, and said to extend to the Straits of Bab-el-Mandeb. Gerloth found it at Bederhumu, a village between Mecca and Medina. Forskal found his Opobalsamum at Hies in Arabia Felix. At Aden it is called Beshan. Dr Roth, in the Appendix to Harris' Abyssinia (ii p 144) mentions B Opobalsamum as occurring in the Adel country, and the jungles of the Hawash along with the Myrrh tree. The bark when wounded exudes the fragrant Balm of Gilead balsam, which seems to have been cultivated in Palestine near the town of Jericho. It is no doubt possessed of stimulant properties

Balsamodendron myrrha Dr Ehrenberg collected from off this tree very fine myrrh on the borders of Arabia Felix. It is stated in the Appendix to Harris' Abyssinia (ii 414) that the "*Balsamodendron myrrha* (Karbeta of the natives) grows on the borders of Effat and in the jungle of the Hawash, and in the Adel desert. The resinous gum called Hofali is collected for exportation

B Opobalsamum (Besham) grows commonly with the former, and grows even at Cape Aden

Mr Johnston, says "there are in the country of Adel two varieties, one a low, thorny, ragged-looking tree, with bright green leaves, trifoliate, and an undulating edge, is that which has been described by Ehrenberg. This produces the finest kind of Myrrh in our shops. This may be either B Myrrha or one of the forms of B Opobalsamum. The other is a more leafy tree, with the appearance of the hawthorn, having the same largely serrated, dark-green leaves, growing in bunches of four or five springing by several leaf-stalks from a common centre. The

flowers are small, of a light green colour hanging in pairs beneath the leaves. The fruit when ripe easily throws off the dry shell in two pieces, and the two seeds it contains escape. The outer bark is thin, transparent, and easily detached, the inner, thick, woody. When wounded, a yellow turbid fluid (the gum-myrrh), immediately makes its appearance. Naturally, the gum exudes from cracks in the bark of the trunk near the root, and flows freely upon the stones immediately underneath. Artificially, it is obtained by bruises made with stones."

Balsamodendron Africum Ainnott — *Hendelonia africana*, *Gurll et Per* first found on the west of Africa, occurs also in the Abyssinian collection, having been found in the flat country of the Adel. Mr Johnston immediately recognized it as one of the trees yielding gum-resin. The leaflets are like those of *B. Kna*, *B. I* yields African Bdelhum, or that imported into France from Guinea and the Senegal, according to M. Ponnottet. M. Adanson mentions it by the Senegal name of Niotont as producing Bdelhum. It may also yield the Bdelhum which is exported from the west coast of Africa. Dr. Malcolmson wrote to Dr. Royle that "bdelhum is produced in Africa by a tree similar to the myrtle, none is obtained in Arabia it is very similar to myrrh, and sometimes sold for it."

One kind of bdelhum is produced in India, which Dr. Royle was informed is yielded by a tree called googul by the natives and which is the *Amvis commiphora* *Roxb* referred by Messrs. Wight and Ainnott to *Balsamodendron*. Dr. Walker, in his account of the drugs produced near Aurungabad, states "a gum-resin, called by the natives googool, is produced by a tree (*Dr. W* calls it *Amvis bdelhum* ? *Roxb*) which grows in the neighbourhood of Umber, a town twenty miles to the westward of Aurungabad. Roxburgh imagined that Googool was identical with Myrrh."

Myrrh is generally in pieces of irregular form and size, formed apparently by agglutinated tears, dry, and covered with a fine dust, commonly of a reddish-brown colour, brittle, fracture irregular, conchoidal, shining with the surface apparently dotted with volatile oil, often variegated, with opaque, whitish, semicircular marks. The smaller pieces angular shining, semi-transparent, taste bitter and aromatic, the smell peculiar and balsamic. Specimens brought by the Abyssinian embassy have granular fragments mixed with roundish tears, and some of a pale, even whitish, colour may be seen on

the same piece of bark with ordinary coloured myrrh. Specimens which have not been exposed to the air, are darker coloured, moister, and of a more powerful and agreeable smell.

Indian Bdelhum is sometimes sold for and considered as an inferior kind of myrrh. It is in roundish pieces of a dull dark-red colour, more moist than myrrh, and not brittle like it, softening even with the heat of the hand, bitter and a little acid in taste, with a less agreeable odour. It often has portions of the birch-like bark adhering to it.

The sort met with in India, and brought from the Arabian and African coasts, is in large opaque pieces, generally covered with a brownish white powder. An inferior kind of myrrh, termed in India Bysabole, is also imported from the above places. It has a great resemblance to bdelhum, for which it is not unfrequently mistaken. Myrrh is largely imported into Bombay, and is chiefly re-exported to England. Myrrh has long been in repute in low fevers in Europe, and occasionally in agues. Dr. Kunk found it very useful in the typhoid state which in India is frequently the second stage of paroxysmal fever and also in the low adynamic fever of jails. In Arabia there is an inferior kind called "busa bol," or "hebbakhade," by the Sumrah. Pliny says, that in his time six different kinds of myrrh grew in Arabia, he says myrrh was often adulterated with mastic. In India, there is a substance having the closest resemblance to myrrh which is imported into and known in Europe as Indian myrrh. This is also said very closely to resemble, if indeed it at all differs from, bdelhum, it is probable, therefore, that it is what in India is known by the name of googul (moogl of the Arabians); as it forms the bdelhum of commerce, and resembles an inferior kind of myrrh, as indeed bdelhum is frequently described to be. That it is also the bdelhum of the ancients would appear from the Persian authors giving bndlevoon and madikoon as the Greek name of moogl. Turkish myrrh is considered the finest, the East Indian being the second in quality, it is employed medicinally, as a dentifrice, and in the preparation of fumigating pastiles — *McCulloch Faulkner Ind Ann Med Sci* for April, 1856, p. 387. *Powell Hand Book*, vol. 1 p. 402. *Birdwood Vegetable products Bombay presidency*, p. 20. *Drury Useful Plants* 88. *Poole St of Commerce*. MYRTUS COMMUNIS

phylus aromaticus, and allspice is the dried berries of *Eugenia pimenta*, plants belonging to the same section of the Myrtaceæ is the common myrtle, the aromatic fruits of the myrtle were indeed used as a spice before cloves and allspice became common. *Punica granatum*, the pomegranate tree, is remarkable for an almost total absence of aromatic qualities and distended so much after the flower has fallen off, that the fruit is nothing but a collection of cavities filled with seeds, and having no apparent relation to each other.

Calyptanthus caryophyllata, is a native of Jamaica, Cuba, and Ceylon. The bark is compact, very hard but brittle, found in commerce in sticks composed of pieces rolled one within the other, of deep brown colour, and greyish white epidermis, the odour is strongly that of the clove, taste aromatic, hot and sharp, slightly bitter and astringent. It contains tannic acid, resin, and essential oil, and is employed chiefly as a spice.

Caryophyllus aromaticus, the clove-tree, is a native of the Molucca Islands. It is a moderately sized tree. The cloves of the shops are the dried compressed flower-buds. — *Roxb Fl Indica* Voigt O'Shaughnessy *Bengal Dispensatory* p 334 Hogg *Vegitable Kingdom*

The myrtle is a native of Asia Minor and south of Europe, it assumes the shrubby or arborescent form according to the latitude. The plant in all its parts is most agreeably perfumed. 10 lbs of the leaves afford about a drachm of yellow essential oil of most delightful fragrance. The berries were employed by the Romans as a spice. The Tuscaus still use them and they also prepare from the berries a kind of wine called *Myrtidannum*. A distilled water prepared from

MYSORE

all parts of the plant is employed as a cosmetic, and called *Eau d'ange* by the French perfumers. The leaves are given in cerebral affections, for flatulence, diarrhoea, internal ulcerations, and rheumatism. The hibb-ul as, though nominally always the fruit of the myrtle, appears at times to be the small fruit of some other plants not yet identified with certainty. The myrtle grows well by layers, and even cuttings, but requires careful pinning, and after the rains all the leaves, on which insects have deposited larvæ must be removed, or the plant will lose its verdure and beauty by the destructiveness of the young caterpillars. — *Lindley*, p 75 *Rudell Gardening Success* *Hints to Amateur Gardeners* Dr J L Stewart *Punjab plants*

MYSOLE, a large island of the Eastern Archipelago in the Pitt Passage extending E and W 42 miles and about 20 miles broad

MYSORE, *Maisur* or *Miheshwar*, a kingdom in the peninsula of India, with a Hindu Maharajah whose territories since A D 1831, have been administered by a Commissioner. It was usurped by Hyder Ali, a Mahomedan soldier, about 1767, but when his son, Tippoo, fell, in 1799, at the storm of Seringapatam, the territory was restored to a descendant of the native sovereign. This chieftain, after he came of age, ruled the country till 1831, when, during Lord W Bentinck's administration, owing to frequent insurrections, Commissioners were appointed for its management. The rajah died childless in the beginning of 1868, but he adopted a successor who, when of age,

will take the Government into his hands Mysore is a table land from 2,000 to 3,000 feet above the sea, fed by the Tunga, the Budra and Caverry rivers Bangalore, Mysore and Seringapatam are its chief towns The genealogy of this family is traced from the Yadu line of Chandravansa The first in authentic history is Timma Raja Vadyar son of Betta, A D 1530, and the dynasty ruled until A D 1767 When Mysore was destroyed by Hyder Ali and the rajah Chamaraja Vadyar dethroned, but the late sovereign, Krishna Raja Vadyar, was restored by the British in 1799 The teakwood used by the Commissariat, and furnished to the Ordnance Department in the Mysore country, was, until about A D 1830, supplied entirely from the Mysore forests, in the vicinity of Shemoogah The jungle however was much thinned towards 1841, and supplies were got from Hullihal, from which to Bangalore is about 170 miles, the roads are tolerably good, the forest is distant from the village about 15 miles Sheep of the Merino breed were introduced into Mysore by Sir Mark Cubbon The coat is of wool, and the article manufactured from it was superior A quantity of wool that was sent home to test the market value attracted the marked attention of the mercantile community The principal difficulty appeared to be the cleansing the fleece from the penetrating spear grasses, with which the pastures of Southern India abound Colonel Onslow also sent home some specimens of cotton to the same Chamber, who reported very favourably of it, and put upon it very high prices A sample of Mysore gamboge, was sent to Dr Royle, who pronounced it to be identical with the gamboge of Siam The coffee is very fine, and a price is obtained for it in England nearly equal to that of the best Mocha It is carried through the ghauts, to Mangalore Fiaserpet is situated on the road to Mysore from Mercara, and it is also 20 miles from the latter place The river Caverry runs past Fiaserpet, and forms the boundary between Coorg and Mysore

The great central table land of the peninsula of India includes Mysore, the Bara-mahal, the Ceded Districts (Bellary and Cuddapah), Berar, Hyderabad, the Southern Mahratta country, and the four Bombay collectorates in the western Deccan The whole of these countries, with the exception of the parts immediately bordering on the ghauts, consist of a vast undulating plain of various height, almost entirely devoid of trees, except close to villages and towns, and with but little low jungle Here and there low ranges of hills appear, and isolated rocks, or

droogs, mostly bare, others covered with low brushwood Towards the north and west large steppes occur, and the country is more broken by hills and ravines than in the southern part Here too we have greater abundance of low jungle, and even stunted trees, and in many of the ravines wood abounds Considerable tracts of long grass, or 'rumnahs' occur here and there, especially towards the more northern portion The whole of this district was formerly named the Deccan meaning the south

Hyder Ali brought Mysore proper, Coorg with the Carnatic and much of the Dekkan under subjugation, and was at the height of his successes when Chum Raj the titular ruler died Up to this time Hyder Ali had professed to rule Mysore in behalf of the hindu rajah, and, every Dassara, Chum Raj appeared before the people in the state balcony, seated on an ivory throne, Hyder Ali being present as Commander-in-Chief and Minister, but he selected a successor, also named Chum Raj, from amongst the collateral relations, and Hyder continued to rule in reality until his death, on the 7th December 1782

The climate of Bangalore or South Eastern Division of Mysore, is favorable to Europeans The thermometer rarely rises above 90 degrees, and the nights all the year round are cool and refreshing The elevation of the Chittledroog or North Eastern division is somewhat less than that of Bangalore In climate it is similar, but the temperature must be higher, even for natives, this division is not considered so healthy as Bangalore, chiefly on account of its hills being feverish The South Eastern division called Astagram, is very different in every respect from the two first named divisions Its southern and western parts are covered with fine jungle extending to the slopes of the western ghats on the one side, and to the base of the Neilgherry Hills on the other There is more rain and it is hotter in this division than in Bangalore, fever prevails during some seasons of the year, but on the whole the climate is generally a healthy one The Nugger division to the north of Astagram possesses an elevation generally from 2,000 to 2,400 feet above the level of the sea, but there are some parts especially the Bababooden Hills which rise above 5,000 feet The open country is described as healthy while the western half is more or less the reverse Two talooks in this division are said to be higher and healthier than other parts They are called Wustara and Chikmoogloor, and there are a good many situations in them where Europeans might settle with every probability of enjoying good health On

this account these talooks appear to have been selected for the cultivation of coffee, and that plant was here more largely and more successfully cultivated than in any part of Mysore. It is added, however, that there now scarcely remains an acre of land in these talooks suitable for coffee unoccupied by natives, who are most tenacious of their rights to the soil. For health and suitability to the European constitution Bangalore and its environs are best, Europeans might settle and labor there with every prospect of good health.

Captain Arthur of the Engineers found Native gold in Mysore, disseminated in quartz, and also in an indurated clay also some specimens crystallized, in minute cubes. Captain Warren discovered gold in Mysore in 1800, between Annemul and Poonganore, disseminated in quartz, and also in the alluvial soil. Two specimens were sent by Lieut. Puckle from the vicinity of Bangalore, one in a matrix of dark blue quartz, and another in black sand, a sufficient quantity was procured to make a ring. The natives have long been working for gold at Batmungalum just above the ghats—Heyne mentions that Captain Warren had learned the fact of the natives so employing themselves, in their leisure, and the fact is repeated by Sir Whitelaw Ainslie and Dr. Clark, the latter of whom remarks that gold was discovered in the eastern provinces of Mysore by Lieut. Warren of H. M. 33rd Regiment in 1802,—who found it in the small nullahs or cuts or breaks in the ground at Wariigum, a small village $4\frac{1}{2}$ miles S. W. of Batmungalum, also on the banks of the Palar river, and the Ponian near Caaigory. He found gold also at Marcoopium three miles south of Wariigum, and worked by natives as it had also been worked by Tippoo. Heyne likewise (p. 41) states that gold has been found near the hills to the S. E. of Ooseottah, and Newbold likewise describes gold as having been discovered by Captain Warren, near the Batterine hills.

A Mysore contingent of 4,000 soldiers has been kept up since the treaty of Seringapatam. The people of Mysore are mostly of the Vira Saiva or Langayet sect.

The Beder or Veder race of Mysore live by the chase, as hunters and fowlers.

The Mysore toddy drawers are called Halipauk, they speak Tuluva.

The first war against Tippoo, king of Mysore, broke out in 1790. Tippoo attacked the rajah of Travancore but was defeated with considerable loss, General Medows,

Colonel Maxwell and Colonel Hartley, having met with varied success, Lord Cornwallis, in 1791, took command, and on the 21st March captured Bangalore. On the 13th May 1791, Tippoo opposed him at Ankera but was completely routed, yet Lord Cornwallis was obliged to retreat. In August 1791, however Cornwallis captured several difficult forts and on the 5th February 1792, he encamped before Seringapatam, and drove the enemy into the fort, and Tippoo came to terms, delivering up half his kingdom, three crores of rupees and two of his sons as hostages. Lord Cornwallis had reached Calcutta in September 1786 and on his return from Mysore, in 1793 he reformed the revenue system of Bengal by a perpetual settlement and he returned then in October to Britain. Mysore territory seems to have been under the control of polygar chiefs, until Hyder Ali assumed the virtual sovereignty in 1742, but in 1799 it passed to a young man whom the British put upon the throne on the storm and capture of Seringapatam, when Tippoo fell in the breach. This Mysore rajah, ruled with little success till 1832, when, during Lord Bentinck's administration, the civil and military jurisdiction was delivered over to a commission, which continues in 1873, until the successor, a minor, comes of age.

The taking of Bangalore from Tippoo sultan, on the 21st March 1791, gave the British a permanent position in Mysore, but it was eight years later, when Seringapatam was stormed on the 4th May 1799 that the country came under British control, by the replacement of the Hindu descendant of former rulers on the throne. The Government was resumed in 1832 at a time when the country had fallen into a deplorable condition. Mysore town is on a table land 2,450 feet above the sea. Mysore table land covers an area of 30,886 sq. miles and contains a population of 3,300,000 souls.—*Madras Literary Society Journal Universal Review*, p. 556. *Madras Exhibition Juries Reports*.

MYSORY or Schouten Island, in the neighbourhood of New Guinea, its northern point is in lat. $0^{\circ} 37' S$. It is high and 60 miles in extent.

MYSCORE-THORN, Eng. *Cæsalpinia sepiaria*, *Rorb*.

MYTE-KONNEY also known as *Tam Poinciana pulcherrima*, *Linn*.

MYTHE, or Make, is a river rising in the Vindhya Mountains, lat. $22^{\circ} 32'$, long. $75^{\circ} 5'$, 1,850 feet above the sea. It runs N. W.,

MYTHOLOGY

145 miles, W 25 miles, S W 180 miles into the Gulf of Cambay, length 350 miles. It receives the Amaos 90, Manchun 55 miles. It is navigable for 15 miles from its mouth. At 50 miles up 100 yards wide.

MYTHOLOGY All the Aryan races have a complicated mythology, which is not the case with the Semitic races. The latter have El, strong, Bel or Baal, Lord, Adonis Lord, Shet, Master, Moloch, King, Ram and Rammon, the Exalted, and other similar terms for their deities. The Aryans, on the contrary, have Zeus, the sky, Phoebus, Apollo, the sun, Neptune, the sea, Mars, war, Venus, beauty, &c. Max Muller has very ingeniously endeavoured to explain this difference by the different character of the language in these two races.

Hindu mythology accords precisely with the Greek in sending the souls of the dead to receive judgment, and according to the sentence of their judge they are thence conveyed to Tartarus or Elysium, to Naraka or Swarga, according to their evil or good deeds.

Grecian mythology is largely mixed up with the mythology of India,—the Ceres of Greece has the Lakshmi of India, Eros of Greece is the Indian Kama, Yama or Dharmarajah is the Grecian Pluto—the Grecian Dionysius is the Indian Rama, Vatarini in the Hindu pantheon has its supposed analogue in the river Styx, and Cerberus has corresponding dogs. Amongst the Hindus, mythology is all pervading. Their history, science, literature, arts, customs, and conversation, are replete with mythological allusions. A respectable knowledge of their pantheon is consequently an almost indispensable preparatory acquirement to the study and comprehension of nearly everything which relates to them. The mythology of India has done much to explain that of Greece and Scandinavia as will be seen by the following list of the principal of the Hindu deities of the present day, and their principal analogues.

Durga, is the analogue of Juno
Narada, god of music—Mercury
Krishna—Apollo
Bhawani—Venus
Kali or Durga = Proserpine
Agni—Vulcan, fire, ignis
Swaha, wife of Agni—Vesta
Aswini-Kumara—Castor and Pollux
Aruna—Aurora
Ata-deva—Diana
Kuvera—Plutus, god of riches
Ganesa—a male Minerva
Indra—Jupiter, god of the firmament
Varuna—Neptune, god of the water

MYTHOLOGY.

Prithivi—Cybele, goddess of earth
Viswakarma—Vulcan, architect of the gods
Kartikeya or Skanda—Mars, the god of war

Kama—Cupid, Eros, god of love
Surya or Arka—Sol, the sun
Hanuman, the monkey god, son of Pavana—Pan

Rama, god of wine—Bacchus
Heracula, an Indian deity—Hercules
Aswiculapa—Esculapius—Genii,
Vaya—Æolus
Sri—Ceres
Anna-Purna—Anna perenna

The religions of the ancient Greeks, though forming collectively one vast polytheistic system, were exceedingly numerous, and dissimilar in their character. Greece and Asia Minor seem to have been parcelled out among a number of deities, each of whom was the paternal god of some city or race, having not only separate rites, but a form of worship widely different. Each deity had his favourite abode, and local attachment, to some valley, or grove, or town, the power and presence of the divinity especially belonged, and hence in Boeotian Thrace, we trace the origins of Bacchus, in northern Thessaly the worship of Apollo, on the Corinthian shores, the rites of Neptune, in Argos, the temples of Juno, and in Ephesus, the worship of Diana. Though acknowledged to be divine out of their own peculiar domains, yet their worshippers were rather averse to proselytism, fearing lest, by an extended communication, the local influence of the deity should be weakened. The sacred object of Ephesian worship, was carefully preserved, from the period of its first formation, through the ages which intervened, till the demolition of pagan temples, which followed upon the rise of christianity. The image consisted of a large block of wood of beech or elm, but, according to some of ebony or vine, shaped into a likeness of the goddess, and evidencing its remote antiquity by the rudeness of its workmanship. The first statues were unshaped blocks and stones, and, hence, the word column, was generally used by the Greeks, to denote a statue. The Greeks worshipped Baal. They identified Baal with Zeus as they did Astarte with Venus. The heaven-fallen idol of Ephesus, was not a representation of the elegant huntress of classic fable, but an Egyptian hieroglyphic, a personification of nature. In this character she was pictured as a woman, having a number of breasts, to denote, according to Jerome, that, as nature

MYTHOLOGY

she was "the nurse, the supporter and life of all living creatures."

So, even to the present day, amongst the hindoos and other idol worshippers of British India, shapeless stones and pieces of wood are worshipped in every village, the three great idols at Jaggernath are three shapeless masses of wood and similar pieces of wood are used as deities on the left bank of the Bhemah river. Also every village has its own local deity, and the idol worshipped at Tripati is quite dissimilar from that at Srirangam — *Lubbock's Origin of Civil*, p 219 *Hind Theat* vol II p 106 *Milner's Seven Churches of Asia*, p 83 *Sir W. Jones*. See Deo, Grama deva, Hindoo

h

needed because, from 10 to 16 bhugalis, according as the rains are heavy or light, are all that a pair of bullocks can get over. There are, generally, two to four potails in a village, not always of the same caste, for instance the village of Khanpur, zillah of Nandani, has four potails, two mahratta, a Canarese speaking lingaet, and a Kulkarni, and there are a few brahman and mahomedan and pariah potails, but a christian potail is unknown.

The northern limits of the Marathi language stretches on the sea coast from the Kolwan hills or country of the Kol, near the Portuguese settlement of Damini, above the ghauts in a north-easterly direction along the Satpura range, parallel to the Nerbudda, intermingling with the Gujarati, about Nandobar, in the jungly valley of the Tapi. It is spoken throughout Berar, in the open parts of the Nagpur territories, and on the whole of its eastern border it abuts on the countries and languages of the Gonds. From Nagpur, the Marathi trends to the south-west, and near the Chaubasha and Si-bhasha villages of Dongopria and Murg'h to Oodghu, from thirty miles west of Bedei to Sangam and Sadasheepet, it meets with the Telugu and Canarese, touching in advance nearly on Bijapur and Shankashwar, and thence trends south-westerly to the coast at Sidasheghur, skirting the western boundary of the Canarese. From Daman in the northern Konkan, Marathi runs down the coast to the neighbourhood of Goa, both below and above the coast. It there meets the Konkani, which runs nearly as far as Mangalore. And the southern limits of this mixed language is a village four miles north of Upi or Oodapi near Condapore, where Tulu or the language of Canara begins.

Konkani, the mixed Konkani tongue, however appears to be only Marathi with a large infusion of Tulu and Canarese words, the former derived from the indigenous inhabitants of Tuluva of Canara, the latter, from the long subjection of this part of the Konkan to Canarese dynasties above the ghauts. Mr H. Mogling however mentions that the Konkani speaking brahmans of Mangalore, consider it quite distinct from, though cognate with, Marathi. Its limits extend from Goa below the ghauts, to the village above mentioned north of Upi. From this part of the coast in northern Canara, a diagonal line, running in a north-easterly direction towards Bedei, marks the boundary between Marathi and Canarese, of the latter at least above the ghauts.

The Guzerati language spoken in the peninsula of that name, is occupied by Rajput tribes, Gujari, Katti, Kuli and Kun-

bi, all claiming a distinct origin. Gujarati is bounded by the Marwadi, a little to the north of Deesa, to the north and east by the Hindi or Rangri Basha of Maleolm, in Rajputana and Malwa respectively, and in the south it dovetails with Marathi in the valleys of the Nerbudda and Tapi, ending at Hamp on the former river and running into Nandobar on the latter.

The Maratha race largely worship deified heroes. There is a celebrated idol, termed Massoba. In the Chanki, pass, in the Lokenwara range, which forms the water-shed between the Godavery and the Tapi about 10 miles north of Anungabad, there is a shrine of this deity to which from a circle of a hundred miles, people of all castes resort, brahmin, sudra and dher, but chiefly the Mahratta kunbi. The Jatra is held in the month Chaita, and lasts for four days, during which many sheep are offered in sacrifice. It is in the northern side of the pass, a mere block of stone, with smaller stones at its foot all smeared with red lead. The objects of their pilgrimage are wholly personal, beseeching the deity to give them, or preserve their children, their flocks and then food. The Mahratta people profess brahminism but, amongst them is a more general amount of demon, spirit, fetish, totem, shaman, and hero worship than is observed amongst the other races of the peninsula. The deities Kandoba and Hanuman, are to be seen in every village south to the Tumbudra, and blood sacrifices of sheep and fowls are largely made. Hanuman is the chief of the village gods, and is invariably smeared over with red lead, which is also applied to every bit of stone or wood that has been erected into a fetish god. There is seemed amongst them, also, a more extensive polytheism, than prevails in any other part of India, and an introduction even of the Semitic and Christian names. Between Ellichpoo and Oomraoti, the pariah races are ordinarily called Krishna, a variation of the word christian, all along the tract southwards to Oodghu the Bawa Adam, near Punderpore, is largely worshipped, and the Jabial Abial, worshipped in east Berar, is evidently the Gabriel or Jibrial of the Semitic races. Even amongst the Kunbi race, who profess brahminism, the hindoo deities Siva and Vishnu are little heard of and with consent the editor put up for two days in the temple of the village of Assaye to which the villagers came at the usual periods to worship Hanuman and the serpent, and the officiating priest to wash and ornament its lingam. An officer of Sindiah's artillery who had fallen in the battle of Assaye had been

buried beneath a tree, and there the villagers continue to worship his spirit. Sickness is usually attributed by them to the influence of a malignant spirit, and all through the Mahatta speaking districts the practice of the "Bolwan" prevails, viz, the ceremony of propitiating the Bhuta or spirits who have entered a village, inducing them to leave the village and conducting them across the borders with music and a procession. The conductors often move to the next village and thereby cause intense fear and anger, as the morbid influence is supposed to be conveyed to it. Ai, mother, equivalent to the southern Ammun, is largely worshipped in the form of a rude stone smeared with red lead, and her temples are to be seen in lone places, passes and defiles. The Mahattas have public recitations of histories or stories of the gods, called Katha (or Kahta) as the Burmans have the Pui, a theatrical representation. The Gondana or Gondala of the Mahattas is a tumultuous festival held in honour of Devi, perhaps the same as Gondhal.

Since Lord Lake's defeat of the Mahrattas near Delhi, and that by Sir Arthur Wellesly at Assaye, the power of the Mahatta chiefs gradually decreased. The privileges of Mahratta Sirdars under British rule date from the time of the reduction of the Deccan about the year 1819 in the war with the peshwa Bajee Rao. The Sirdars were high officers under the raja of Sattara and the peshwa. Their titles correspond to those of Quarter Master General, Keeper of the Records, Prime Minister, Private Counsellor, &c. Some as the Vinchurkar in Ahmednuggur zillah and the nawab of Sadeinun near Dharwar held such offices under Aurunzeb and other mogul emperors. A few of the lesser Sirdars were feudatories of smaller local chiefs. The grasping policy of the last peshwa, Bajee Rao, made most of them alarmed and discontented. Accordingly, after the battle of Kirkee, most of them were willing to accept the liberal terms offered in the proclamations of Mount Stuart Elphinstone and the other great men who reduced the different provinces. They were as a rule guaranteed the enjoyment of their ancient rights and privileges by treaties entered into by the British Government and still in force. These treaties bind them to provide a contingent of troops, to make adequate police and judicial arrangements in consultation with the Political Agents, for the extradition of criminals. They have generally exclusive civil and criminal jurisdiction in their own territories, in many cases, however, as for example in those of the first class Sirdars

under the Political Agent of Sattara, the treaty provides that in grave offences such as murder, the trial shall take place before the Agent. They are allowed to make their own Revenue Settlements and are not bound to give leases for a definite term as the British Government is by the Survey Act. The amount of assessment and other taxes they are entitled to collect is unlimited. This is a source of constant complaint among their ryots who envy the secure and liberal terms given by the British government. The political privileges of Sirdars are the following. By Regulation 29 of 1827 it was provided that suits against certain persons of rank should not come under the jurisdiction of the Civil Courts. Three classes of Sirdars were thereby established and three several modes of procedure defined. An Agent of Government, now styled the Agent to the Governor for Sirdars in the Deccan, was appointed to try such suits against them as would ordinarily be cognizable by the Judges of Poona or Ahmednuggur. The First Class being persons of the highest consideration under the Peshwa's Government, reference is to be had in the most ample degree to their former privileges as by usage and custom enjoyed. No decree of the Agent against a Sirdar is to be executed without the order of the Governor in Council to whom also plaintiff may appeal, a further appeal to the Queen in Council being open to either party. Suits against the second class are conducted with the same regard for former privilege and usage. The Agent is also to consider the present means of the Sirdar of discharging the debt and to apply equity. Appeal lies to the superior court of the Governor in Council but the decree may be executed against defendant by the Agent himself. The final appeal is as before to the Privy Council. Many of the Sirdars had contracted heavy debts or lost their property in the war with the Peshwa, hence the provision for considering their means in the decree. As the Agent is an Administrative as well as a Judicial Officer, he has ample means of ascertaining their circumstances. The third class of Sirdars are entitled to a similar but rather less regard being had to usage and custom. The strict rules of procedure are, if necessary, to be relaxed in their favour especially as regards decree, appeal lies to the High Court and thence to the Privy Council, but it is the practice of the Governor in Council, as a Special Court, to refer appeals for the opinion of the Judges of the High Court. The Agent for Sirdars is the Judge of Poona. He sits as Agent every Friday, both as a political and
